GRAVIMETRIC FACTORS AND THEIR LOGARITHMS

Rudolf Loebel

Compiled from International atomic weights of 1964. To facilitate use of this table the group of substances weighed under each element as well as the substance sought under each substance weighed are arranged in alphabetical order of their formulas.

Weighed	Sought	Factor	Log of Factor +10	Reciprocal of Factor	Log of Reciprocal of Factor +10

PHYSICAL CONSTANTS OF MINERALS

Compiled by Ralph Kretz

The following table presents data for many of the more common minerals.

In order to avoid duplication and save space, very few cross references are given in the body of the table. If the name sought is not found in the table, consult the **synonym index** given below.

Specific gravities are given at normal atmospheric temperatures, a more precise statement being valueless considering the large variations in natural minerals.

Hardness is given in terms of Mohs' scale. (See under Hardness.)

Indices of refraction for the sodium line, $\lambda = 5893$ Å, unless otherwise indicated. Li, $\lambda = 6708$ Å. Indices will invariably be given in the order ω, ϵ or α, β, γ. Uniaxial crystals are considered positive if $\epsilon > \omega$, negative if $\omega > \epsilon$. Biaxial crystals are considered positive if β is nearer α in value than it is γ and negative if β is nearer γ than α.

ABBREVIATIONS

Abbreviation	Meaning of abbreviation	Abbreviation	Meaning of abbreviation	Abbreviation	Meaning of abbreviation

SYNONYM INDEX

Compound sought	Listed	Compound sought	Listed
Acmite	Aegirine	Lead sulfate	Anglesite
Agate	Quartz (impure)	Lead sulfide	Galena
Aluminum hydroxide	Boehmite, Diaspore, Gibbsite	Limonite	Goethite (impure)
Amphibole	Actinolite, Anthophyllite, Cummingtonite, Glaucophane, Hornblende, Riebeckite, Tremolite	Lithiophyllite	Triphylite
		Lithium mica	Lepidolite
		Lodestone	Magnetite
Antimony oxide	Senarmontite, Valentinite	Magnesium carbonate	Magnesite
Antimony sulfide	Stibnite	Magnesium hydroxide	Brucite
Arsenic oxide	Arsenolite, Claudetite	Magnesium oxide	Periclase
Arsenic sulfide	Orpiment, Realgar	Magnesium sulfate	Kieserite
Barium carbonate	Witherite	Manganese carbonate	Rhodochrosite
Barium sulfate	Barite	Manganese hydroxide	Pyrochroite
Barytes	Barite	Manganese oxide	Hausmannite, Manganosite, Pyrolusite
Bauxite	Gibbsite, Boehmite, Diaspore		
Brimstone	Sulfur	Manganese sulfide	Alabandite
Bronzite	Orthopyroxene	Meerschaum	Serpentine
Cadmium sulfide	Greenockite	Mica	Muscovite, Paragonite, Phlogopite, Biotite, Lepidolite
Calamine	Hemimorphite		
Calcium carbonate	Aragonite, Calcite, Vaterite	Native copper	Copper
Calcium sulfate	Anhydrite, Gypsum	Native gold	Gold
Calcium sulfide	Oldhamite	Nickel oxide	Bunsenite
Carborundum	Moissanite	Nickel sulfide	Millerite
Chalcedony	Quartz (impure, fibrous)	Orthite	Allanite
Chinaclay	Kaolinite	Penninite	Chlorite
Chloanthite	Skutterodite	Peridote	Olivine
Chromespinel	Chromite	Pistacite	Epidote
Chrysolite	Serpentine	Pitchblende	Uraninite
Clinoptolite	Heulandite	Plagioclase	Albite, Oligoclase, Andesine, Anorthite
Clayminerals	Illite, Kaolinite, Montmorillonite		
Clinochlore	Chlorite	Potassium chloride	Sylvite
Cobaltbloom	Erythrite	Potassium sulfate	Arcanite
Copper chloride	Nantokite	Pyroxene	Diopsite, Angite, Aegirine, Jadeite, Pigeonite, Eustatite, Orthopyroxene
Copper oxide	Cuprite		
Copper sulfide	Chalcocite, Covellite, Digenite		
Emerald	Beryl	Rocksalt	Halite
Emery	Mixture of Corundum, Magnetite and other minerals	Ruby	Corundum
		Sapphire	Corundum
Epsom salt	Epsomite	Silica	Christobalite, Quartz, Tridymite
Feldspar	Orthoclase, Microcline, Anorthoclase, Albite, Oligoclase, Andesine, Anorthite	Silver chloride	Cerargyrite
		Silver iodide	Jodyrite, Miersite
		Silver sulfide	Acanthite, Argentite
Fibrolite	Sillimanite	Smalltite	Skutterotite
Flint	Quartz (impure)	Soapstone	Mixture of Talc and other minerals
Fluorapatite	Apatite	Sodium chloride	Halite
Fluorspar	Fluorite	Sodium sulfate	Thenardite
Garnet	Almandine, Pyrope, Spessartite, Andradite, Grossularite, Uvarovite, Hydrogrossularite	Strontium carbonate	Strontianite
		Strontium sulfate	Celestite
		Thorium oxide	Thorianite
Garnierite	Serpentine (Ni-bearing)	Tin oxide	Cassiterite
Glauber salt	Mirabilite	Titanite	Sphene
Hyacinth	Zircon	Titanium oxide	Anatase, Brookite, Rutile
Iceland spar	Calcite	Uranium oxide	Uraninite
Idocrase	Vesuvianite	Zeolite	Natrolite, Mesolite, Scolecite, Thomasonite, Harmatome, Eddingtonite, Heulandite, Stilbite, Phillipsite, Chabazite, Gmelinite, Levyn, Laumontite, Mordenite
Iron carbonate	Siderite		
Iron hydroxide	Goethite, Lepidocrocite		
Iron oxide	Hematite, Magnetite		
Iron spinel	Hercynite		
Iron sulfide	Marcasite, Pyrite, Pyrrhotite	Zincblende	Sphalerite
Lapis lazuli	Lazurite	Zinc carbonate	Smithsonite
Lead carbonate	Cerussite	Zinc oxide	Zincite
Lead chloride	Cotunnite	Zinc spinel	Gahnite
Lead chromate	Crocoite	Zinc sulfide	Sphalerite, Wurtzite
Lead oxide	Litharge, Minium	Zirconium oxide	Baddeleyite

PHYSICAL CONSTANTS OF MINERALS

SOLUBILITY PRODUCT

The solubility product (or ion product constant) is the product of the concentrations of the ions in the saturated solution of a difficultly soluble salt. The concentrations are expressed as moles per liter of solution. The number of cations (or anions) resulting from the dissociation of one molecule of the salt, appears in the formula for calculations of the solubility product as the exponent of the concentration of the cation (or anion).

If two solutions, each containing one of the ions of a difficultly soluble salt, are mixed, no precipitation takes place unless the product of the ion concentrations in the mixture is greater than the solubility product.

In a solution containing two salts which yield a common ion the ratio of solubilities of the two salts is the ratio of the solubility products.

X-Ray Crystallographic Data, Molar Volumes, and Densities of Minerals and Related Substances

From U.S. Geological Survey Bulletin 1248 by
Richard A. Robie, Philip M. Bethke and Keith M. Beardsley

An extensive list of references and the bases for the calculations and the selection of data are given in the above referenced Bulletin. Bulletin 1248 may be obtained from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402.

X-Ray Crystallographic Data of Minerals

Z; The number of gram formula weights per unit cell.

r; Indicates the data were obtained at an unspecified room temperature and may be taken as 25° ±5°C.

*; Indicates the measurements were made on a natural specimen which may have deviated slightly from the listed formula. Densities for these minerals were calculated using the formula weight for the stoichiometric phase.

hex-R; Rhombohedral symmetry. To distinguish from true hexagonal symmetry.

DEFINITIVE RULES FOR NOMENCLATURE OF ORGANIC CHEMISTRY

IUPAC 1957 Rules.

Section A. Hydrocarbons

Section B. Fundamental Heterocyclic Systems

These rules are taken from 'Definitive Rules for the Nomenclature of Organic Chemistry' which were adopted unanimously by the Commission on Nomenclature and by The Council of the International Union of Pure and Applied Chemistry at Paris 1957, and subsequently published by Butterworths Scientific Publications on behalf of the Union. The extracts are printed here by permission of the Union and of Butterworths Scientific Publications. Future 'tentative' rules will be published in the Bulletin of the Union, and when made 'definitive' in its Journal 'Pure and Applied Chemistry.'

RULES

A. HYDROCARBONS

Acyclic Hydrocarbons

A-1

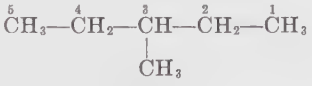
1.1.—The first four saturated unbranched acyclic hydrocarbons are called methane, ethane, propane and butane. Names of the higher members of this series consist of a numerical prefix and the termination "-ane." Examples of these numerical prefixes are shown in the table below. The generic name of saturated acyclic hydrocarbons (branched or unbranched) is "alkane."

Examples:

n		*n*		*n*		*n*	
1	Methane	12	Dodecane	22	Docosane	32	Dotriacontane
2	Ethane	13	Tridecane	23	Tricosane	33	Tritriacontane
3	Propane	14	Tetradecane	24	Tetracosane	40	Tetracontane
4	Butane	15	Pentadecane	25	Pentacosane	50	Pentacontane
5	Pentane	16	Hexadecane	26	Hexacosane	60	Hexacontane
6	Hexane	17	Heptadecane	27	Heptacosane	70	Heptacontane
7	Heptane	18	Octadecane	28	Octacosane	80	Octacontane
8	Octane	19	Nonadecane	29	Nonacosane	90	Nonacontane
9	Nonane	20	Eicosane	30	Triacontane	100	Hectane
10	Decane	21	Heneicosane	31	Hentriacontane	132	Dotriacontahectane
11	Undecane						

1.2.—Univalent radicals derived from saturated unbranched acyclic hydrocarbons by removal of hydrogen from a terminal carbon atom are named by replacing the ending "-ane" of the name of the hydrocarbon by "-yl." The carbon atom with the free valence is numbered as 1. As a class, these radicals are called normal, or unbranched-chain, alkyls.

Examples:



Pentyl $\overset{5}{C}H_3—\overset{4}{C}H_2—\overset{3}{C}H_2—\overset{2}{C}H_2—\overset{1}{C}H_2—$

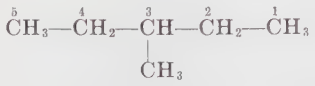
Undecyl $\overset{11}{C}H_3—[\overset{10-2}{C}H_2]_9—\overset{1}{C}H_2—$

A-2

2.1.—A saturated branched acyclic hydrocarbon is named by prefixing the designations of the side chains to the name of the longest chain present in the formula.

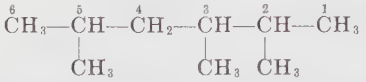
Example:

3-Methylpentane



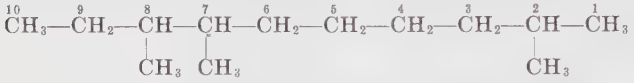
These names are retained for unsubstituted hydrocarbons only

Isobutane	$(CH_3)_2CH—CH_3$
Isopentane	$(CH_3)_2CH—CH_2—CH_3$
Neopentane	$(CH_3)_4C$
Isohexane	$(CH_3)_2CH—CH_2—CH_2—CH_3$

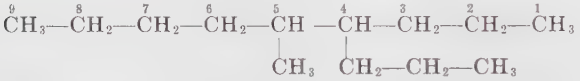


Chemical Abstracts index names for the above compounds are 2-methylpropane, 2-methylbutane, 2,2-dimethylpropane, and 2-methylpentane.

2.2.—The longest chain is numbered from one end to the other by arabic numerals, the direction being so chosen as to give the lowest numbers possible to the side chains. When series of locants containing the same number of terms are compared term by term, that series is "lowest" which contains the lowest number on the occasion of the first difference. This principle is applied irrespective of the nature of the substituents.



Examples:



3-Methylpentane

2,3,5-Trimethylhexane (not 2,4,5-Trimethylhexane)

2,7,8-Trimethyldecane (not 3,4,9-Trimethyldecane)

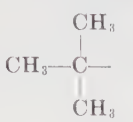
5-Methyl-4-propylnonane (not 5-Methyl-6-propylnonane since 4,5 is lower than 5,6)

2.25.—Univalent branched radicals derived from alkanes are named by prefixing the designation of the side chains to the name of the unbranched alkyl radical possessing the longest possible chain starting from the carbon atom with the free valence, the starting atom being numbered as 1.

Examples:

1-Methylpentyl	$CH_3CH_2CH_2CH_2CH(CH_3)—$
2-Methylpentyl	$CH_3CH_2CH_2CH(CH_3)CH_2—$
5-Methylhexyl	$(CH_3)_2CHCH_2CH_2CH_2CH_2—$

These names are retained for the unsubstituted radicals only



Isopropyl	$(CH_3)_2CH—$
Isobutyl	$(CH_3)_2CHCH_2—$
sec-Butyl	$CH_3CH_2CH(CH_3)—$
tert-Butyl	$(CH_3)_3C—$
Isopentyl	$(CH_3)_2CHCH_2CH_2—$
Neopentyl	$(CH_3)_3CCH_2—$
tert-Pentyl	$CH_3CH_2C(CH_3)_2—$
Isohexyl	$(CH_3)_2CHCH_2CH_2CH_2—$

2.3.—If two or more side chains of different nature are present, they may be cited (a) in order of increasing complexity or (b) in alphabetical order.

(a) The side chains are arranged in order of increasing complexity by applying the following criteria in series until a decision is reached:

(i) The less complex is that containing the smaller total number of carbon atoms.

Examples:

less complex than

(ii) The less complex is that containing the longer straight chain.

Example:

(iii) The less complex is that whose longest substituent has the lower locant.

Example:

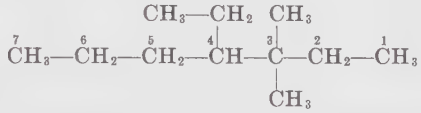
(iv) The less complex is that whose next longest substituent has the lower locant.

Example:

(v) The less complex is that which is the more saturated.

Example:

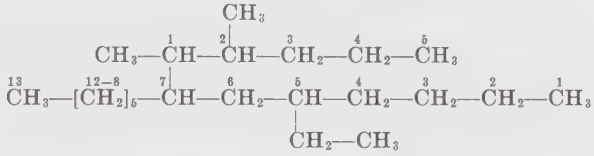
(vi) The less complex is that whose multiple linkage has the lower locant.



Example:

(b) The alphabetical order is decided as follows:

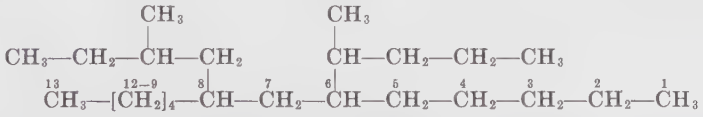
(i) The names of simple radicals are first alphabetized and the multiplying prefixes are then inserted.



Example:

ethyl is cited before methyl, thus 4-Ethyl-3,3-dimethylheptane

(ii) The name of a complex radical is considered to begin with the first letter of its complete name.

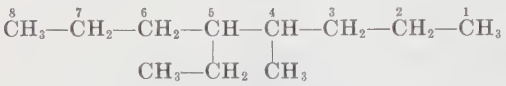


Example:

dimethylpentyl (as a complete single substituent) is alphabetized under "d," thus
7-(1,2-Dimethylpentyl)-5-ethyltridecane

(iii) In cases where complex radicals are composed of identical words, priority for citation is given to that radical which contains the lowest locant at the first cited point of difference in the radical.

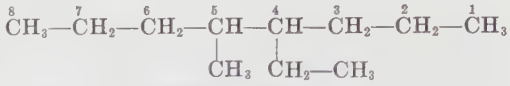
Example:



6-(1-Methylbutyl)-8-(2-methylbutyl)tridecane

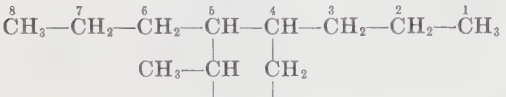
Chemical Abstracts has long been a proponent of the alphabetical order for prefixes. The alphabetical order as given in **A-2.3**(b) is the order used by *Chemical Abstracts*.

2.4.—If two or more side chains are in equivalent positions, the one to be assigned the lower number is that cited first in the name, whether the order of citation is based on complexity or on the alphabetical order.

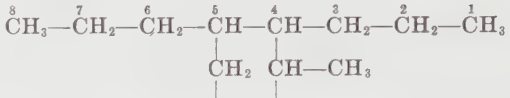


Examples:

(a) Order based on complexity

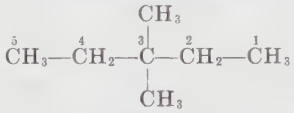


4-Methyl-5 ethyloctane



(b) Alphabetical order

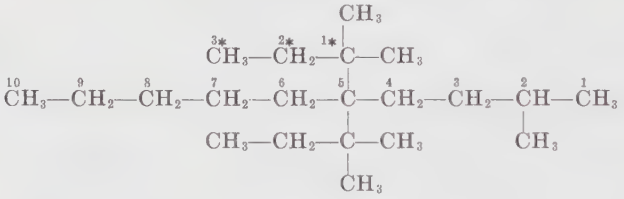
4 Ethyl-5-methyloctane



4-Propyl-5-isopropyloctane

4-Isopropyl-5-propyloctane

2.5.—The presence of identical unsubstituted radicals is indicated by the appropriate multiplying prefix di-, tri-, tetra-, penta-, hexa-, hepta-, octa-, nona-, deca-, undeca-, *etc.*

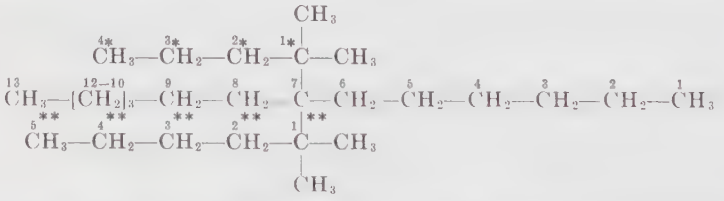


Example:

3,3-Dimethylpentane

The presence of identical radicals each substituted in the same way may be indicated by the appropriate multiplying prefix bis-, tris-, tetrakis-, pentakis, *etc.* The complete expression denoting a side chain may be enclosed in parentheses or the carbon atoms in side chains may be indicated by primed numbers.

Example:

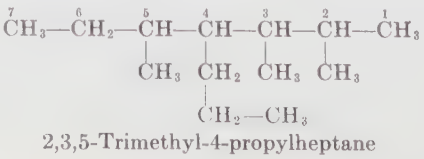


(a) Use of primes and order of complexity, * indicates primed numbers: 2-Methyl-5,5-bis-1′,1′-dimethylpropyldecane.

(b) Use of parentheses and alphabetical order, * indicates unprimed numbers: 5,5-Bis(1,1-dimethylpropyl)-2-methyldecane.

(c) Use of primes and alphabetical order, * indicates primed numbers: 5,5-Bis-1′,1-dimethylpropyl-2-methyldecane.

Chemical Abstracts uses parentheses and the alphabetical order without primes (**A-2.5(b)**). *Chemical Abstracts* would name the example in (b) 2-Methyl-5,5-di-*tert*-pentyldecane.

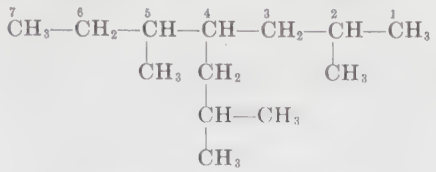


(a) Use of primes and order of complexity, * indicates primed numbers, ** indicates doubly primed numbers: 7-1′,1′-Dimethylbutyl-7-1″,1″-dimethylpentyltridecane.

(b) Use of parentheses and alphabetical order, * and ** indicate unprimed numbers: 7-(1,1-Dimethylbutyl)-7-(1,1-dimethylpentyl)-tridecane

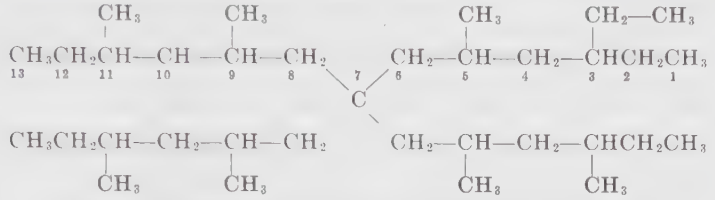
2.6.—If chains of equal length are competing for selection as main chain in a saturated branched acyclic hydrocarbon, then the choice goes in series to:

(a) The chain which has the greatest number of side chains.



Example:

2,3,5-Trimethyl-4-propylheptane

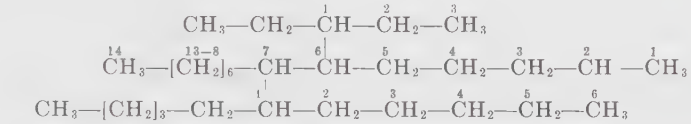


(b) The chain whose side chains have the lowest-numbered locants.

Example:

4-Isobutyl-2,5-dimethylheptane

(c) The chain having the greatest number of carbon atoms in the smaller side chains.



7,7-Bis(2,4-dimethylhexyl)-3-ethyl-5,9,11-trimethyltridecane

(d) The chain having the least branched side chains.

(1) Here the choice lies between two possible main chains of equal length, each containing six side chains in the same positions. Listing in increasing order, the number of carbon atoms in the several side chains of the first choice as shown and of the alternate second choice results as follows:

first choice	1, 1, 1, 2, 8, 8
second choice	1, 1, 1, 1, 8, 9

The expression, "the greatest number of carbon atoms in the smaller side chains," is taken to mean the largest side chain at the first point of difference when the size of the side chains is examined step by step. Thus, the selection in this case is made at the fourth step where 2 is greater than 1.

6-(1-Ethylpropyl)-7-(1-pentylhexyl)tetradecane

A-3

3.1.—Unsaturated unbranched acyclic hydrocarbons having one double bond are named by replacing the ending "-ane" of the name of the corresponding saturated hydrocarbon with the ending "-ene." If there are two or more double bonds, the ending will be "-adiene," "-atriene," *etc.* The generic names of these hydrocarbons (branched or unbranched) are "alkene," "alkadiene," "alkatriene," *etc.* The chain is so numbered as to give the lowest possible numbers to the double bonds.

Examples:

2-Hexene $CH_3-CH_2-CH_2-CH=CH-CH_3$

1,4-Hexadiene $CH_3-CH=CH-CH_2-CH=CH_2$

These non-systematic names are retained

Ethylene $CH_2=CH_2$ Allene $CH_2=C=CH_2$

Chemical Abstracts retains allene for the unsubstituted hydrocarbon only.

3.2.—Unsaturated unbranched acyclic hydrocarbons having one triple bond are named by replacing the ending "-ane" of the name of the corresponding saturated hydrocarbon with the ending "-yne." If there are two or more triple bonds, the ending will be "-adiyne," "-atriyne," *etc.* The generic names of these hydrocarbons (branched or unbranched) are "alkyne," "alkadiyne," "alkatriyne," *etc.* The chain is so numbered as to give the lowest possible numbers to the triple bonds.

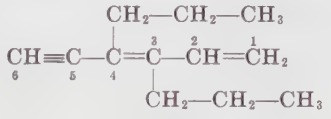
The name "acetylene" for $HC\equiv CH$ is retained.

3.3.—Unsaturated unbranched acyclic hydrocarbons having both double and triple bonds are named by replacing the ending "-ane" of the name of the corresponding saturated hydrocarbon with the ending "-enyne," "-adienyne," "-atrienyne," "-enediyne," *etc.* Numbers as low as possible are given to double

and triple bonds even though this may at times give "-yne" a lower number than "-ene." When there is a choice in numbering the double bonds are given the lowest numbers.

Examples:

1,3-Hexadien-5-yne $HC^{6}\equiv C^{5}-CH^{4}=CH^{3}-CH^{2}=CH^{1}_{2}$

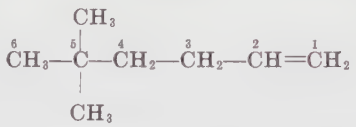


3-Penten-1-yne $CH^{5}_{3}-CH^{4}=CH^{3}-C^{2}\equiv CH^{1}$

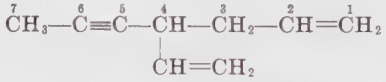
1-Penten-4-yne $HC^{5}\equiv C^{4}-CH^{3}_{2}-CH^{2}=CH^{1}_{2}$

3.4.—Unsaturated branched acyclic hydrocarbons are named as derivatives of the unbranched hydrocarbons which contain the maximum number of double and triple bonds. If there are two or more chains competing for selection as the chain with the maximum number of unsaturated bonds, then the choice goes to (1) that one with the greatest number of carbon atoms; (2) the number of carbon atoms being equal, the one containing the maximum number of double bonds. In other respects, the same principles apply as for naming saturated branched acyclic hydrocarbons. The chain is so numbered as to give the lowest possible numbers to double and triple bonds in accordance with Rule **A-3.3.**

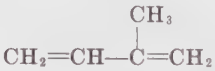
Examples:



3,4-Dipropyl-1,3-hexadien-5-yne



5-Ethynyl-1,3,6-heptatriene



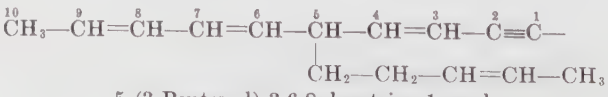
5,5-Dimethyl-1-hexene

4-Vinyl-1-hepten-5-yne

The name "isoprene" is retained for the unsubstituted compound only

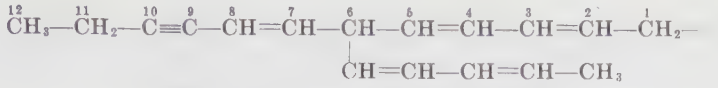
3.5.—The names of univalent radicals derived from unsaturated acyclic hydrocarbons have the endings "-enyl," "-ynyl," "-dienyl," *etc.*, the positions of the double and triple bonds being indicated where necessary. The carbon atom with the free valence is numbered as 1.

Examples:



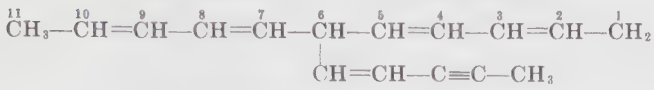
Ethynyl	$CH\equiv C-$
2-Propynyl	$CH\equiv C-CH_2-$
1-Propenyl	$CH_3-CH=CH-$
2-Butenyl	$CH_2-CH=CH-CH_2-$
1,3-Butadienyl	$CH_2=CH-CH=CH-$
2-Pentenyl	$CH_3-CH_2-CH=CH-CH_2-$
2-Penten-4-ynyl	$CH\equiv C-CH=CH-CH_2-$

Exceptions: These names are retained

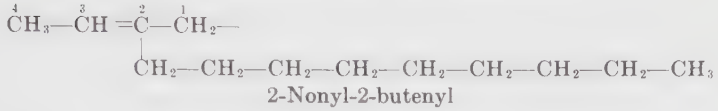


Vinyl (for ethenyl)	$CH_2=CH-$
Allyl (for 2-propenyl)	$CH_2=CH-CH_2-$
Isopropenyl (for 1-methylvinyl)	$CH_2=C(CH_3)-$ (for unsubstituted radical only)

3.6.—When there is a choice for the fundamental chain of a radical, that chain is selected which contains (1) the maximum number of double and triple bonds; (2) the largest number of carbon atoms, and (3) the largest number of double bonds.



Examples:



5-(3-Pentenyl)-3,6,8-decatrien-1-ynyl

6-(1,3-Pentadienyl)-2,4 7-dodecatrien-9-ynyl

6-(1-Penten-3-ynyl)-2,4,7,9-undecatetraenyl

2-Nonyl-2-butenyl

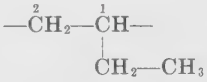
A-4

4.1.—Bivalent and trivalent radicals derived from univalent acyclic hydrocarbon radicals whose authorized names end in "-yl" by removal of one or two hydrogen atoms from the carbon atom with the free valences are named by adding "-idene" or "-idyne," respectively, to the name of the corresponding univalent radical. The carbon atom with the free valence is numbered as 1.

The name "methylene" is retained for the radical $CH_2{=}$.

Examples:

Methylidyne[1]	$CH{\equiv}$
Ethylidene	$CH_3{-}CH{=}$
Ethylidyne	$CH_3{-}C{\equiv}$
Vinylidene	$CH_2{=}C{=}$
Isopropylidene[2]	$(CH_3)_2C{=}$



4.2.—The names of bivalent radicals derived from normal alkanes by removal of a hydrogen atom from each of the two terminal carbon atoms of the chain are ethylene, trimethylene, tetramethylene, *etc.*

Examples:

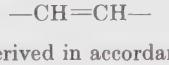
Pentamethylene	$-CH_2-CH_2-CH_2-CH_2-CH_2-$
Hexamethylene	$-CH_2-CH_2-CH_2-CH_2-CH_2-CH_2-$

Names of the substituted bivalent radicals are derived in accordance with Rules **A-2.2** and **A-2.25.**

Example:

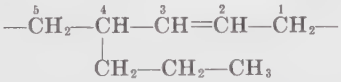
Ethylethylene 

The name "propylene" is retained



4.3.—Bivalent radicals similarly derived from unbranched alkenes, alkadienes, alkynes, *etc.*, by removing a hydrogen atom from each of the terminals carbon atoms are named by replacing the endings "-ene," "-diene," "-yne," *etc.*, of the hydrocarbon name by "-enylene," "-dienylene," "-ynylene," *etc.*, the positions of the double and triple bonds being indicated where necessary.

Example:



Propylene 

The name "vinylene" is retained (for ethenylene)

Names of the substituted bivalent radicals are derived in accordance with Rule **A-3.4.**

Examples:

4 Propyl-2-pentenylene 

4.4.—Trivalent, quadrivalent and higher valent acyclic hydrocarbon radicals of two or more carbon atoms with the free valences at each end of a chain are named by adding to the hydrocarbon name the

(1) The group $=CH-$ may be referred to as the "methine" group.

(2) For unsubstituted radical only.

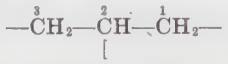
terminations "-yl" for a single free valence, "-ylidene" for a double and "-ylidyne" for a triple free valence on the same atom (the final "e" in the name of the hydrocarbon is elided when followed by a suffix beginning with "-yl"). If different types are present in the same radical, they are cited and numbered in the order of "-yl" "-ylidene," "-ylidyne."

Examples:

Butanediylidene $=\overset{4}{C}H-\overset{3}{C}H_2-\overset{2}{C}H_2-\overset{1}{C}H=$

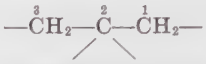
Butanediylidyne $\equiv\overset{4}{C}-\overset{3}{C}H_2-\overset{2}{C}H_2-\overset{1}{C}\equiv$

1-Propanyl-3-ylidene $=\overset{3}{C}H-\overset{2}{C}H_2-\overset{1}{C}H_2-$



Propadienediylidene $=\overset{3}{C}=\overset{2}{C}=\overset{1}{C}=$

2-Pentenediylidyne $\equiv\overset{5}{C}-\overset{4}{C}H_2-\overset{3}{C}H=\overset{2}{C}H-\overset{1}{C}\equiv$

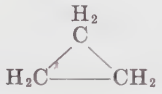


1-Butanyliden-4-ylidyne $\equiv\overset{4}{C}-\overset{3}{C}H_2-\overset{2}{C}H_2-\overset{1}{C}H=$

4.5.—Multivalent radicals containing three or more carbon atoms with free valences at each end of a chain and additional free valences at intermediate carbon atoms are named by adding the ending "-triyl," "-tetrayl," "-diylidene," "diylylidene," *etc.*, to the hydrocarbon name.

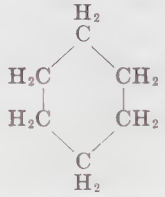
Examples:

1,2,3-Propanetriyl



1,3-Propanediyl-2-ylidene

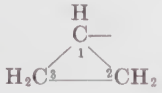
Monocyclic Hydrocarbons



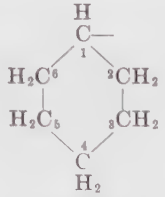
A-11

11.1.—The names of saturated monocyclic hydrocarbons (with no side chains) are formed by attaching the prefix "cyclo" to the name of the acyclic saturated unbranched hydrocarbon with the same number of carbon atoms. The generic name of saturated monocyclic hydrocarbons (with or without side chains) is "cycloalkane."

Examples:



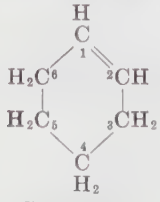
Cyclopropane



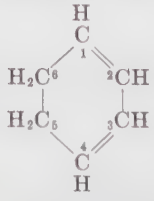
Cyclohexane

11.2.—Univalent radicals derived from cycloalkanes (with no side chains) are named by replacing the ending "-ane" of the hydrocarbon name by "-yl," the carbon atom with the free valence being numbered as 1. The generic name of these radicals is "cycloalkyl."

Examples:

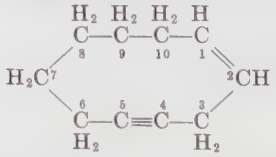


Cyclopropyl



Cyclohexyl

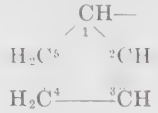
11.3.—The names of unsaturated monocyclic hydrocarbons (with no side chains) are formed by substituting "-ene," "-adiene," "-atriene," "-yne," "-adiyne," *etc.*, for "-ane" in the name of the corresponding cycloalkane. The double and triple bonds are given numbers as low as possible as in Rule **A-3.3.**



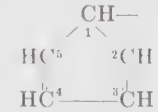
Examples:

Cyclohexene

1,3-Cyclohexadiene



1-Cyclodecen-4-yne

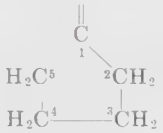


The names "fulvene" (for methylenecyclopentadiene) and "benzene" are retained.

11.4.—The names of univalent radicals derived from unsaturated monocyclic hydrocarbons have the endings "-enyl," "-ynyl," "-dienyl," *etc.*, the positions of the double and triple bonds being indicated according to the principles of Rule **A-3.3.** The carbon atom with the free valence is numbered as 1, except as stated in the rules for terpenes(see Rules **A-72** to **A-75**).

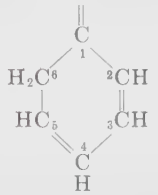
Examples:

2-Cyclopenten-1-yl



2,4-Cyclopentadien-1-yl

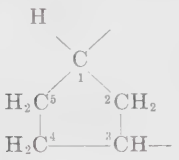
The radical name "phenyl" is retained.



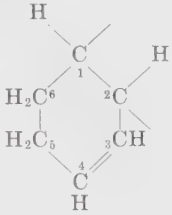
The point of attachment is numbered 1 and the double and triple bonds are given numbers as low as possible. The number 1 for the point of attachment is given in the radical name to emphasize the fact that the point of attachment takes precedence over the double and triple bonds (except with terpenes which have fixed numberings).

11.5.—Names of bivalent radicals derived from saturated or unsaturated monocyclic hydrocarbons by removal of two atoms of hydrogen from the same carbon atom of the ring are obtained by replacing the endings "-ane," "-ene," "-yne," by "-ylidene," "-enylidene" and "-ynylidene," respectively. The carbon atom with the free valences is numbered as 1, except as stated in the rules for terpenes.

Examples:

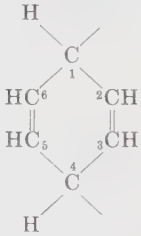


Cyclopentylidene



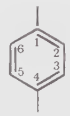
2,4-Cyclohexadien-1-ylidene

11.6.—Bivalent radicals derived from saturated or unsaturated monocyclic hydrocarbons by removing a hydrogen atom from each of two different carbon atoms of the ring are named by replacing the endings "-ane," "-ene," "-diene," "-yne," *etc.*, of the hydrocarbon name by "-ylene," "-enylene," "-dienylene," "-ynylene," *etc.*, the positions of the double and triple bonds and of the points of attachment being indicated. Preference in lowest numbers is given to the carbon atoms having the free valences.



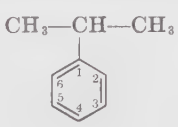
Examples:

1,3-Cyclopentylene

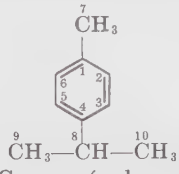


3-Cyclohexen-1,2-ylene

2,5-Cyclohexadien-1,4-ylene

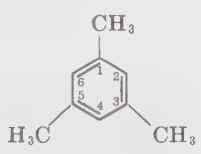


The name "phenylene" is retained

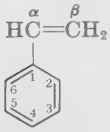


Phenylene (*p*-shown)

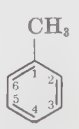
A-12



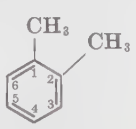
12.1.—These names for substituted monocyclic aromatic hydrocarbons are retained



Cumene



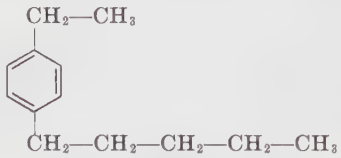
Cymene (*p*-shown)



Mesitylene

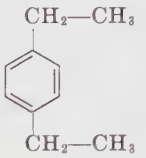
Styrene

Toluene



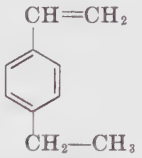
Xylene (*o*-shown)

12.2.—Other substituted monocyclic aromatic hydrocarbons are named as derivatives of benzene or of one of the compounds listed in Part **1** of this rule. However, if the substituent introduced into such a compound, is identical with one already present in that compound, then the substituted compound is named as a derivative of benzene (see Rule **61.4**).



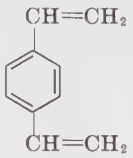
Chemical Abstracts makes certain exceptions to the last part of this rule in order to favor a larger parent, although still treating like groups alike, *e.g.*, an *ar*-methyl derivative of cymene is indexed at Cumene, dimethyl-, not at Benzene, isopropyldimethyl-.

12.3.—The position of substituents is indicated by numbers except that *o-* (*ortho-*), *m-* (*meta-*) and *p-* (*para-*) may be used in place of 1,2-, 1,3-, and 1,4-, respectively, when only two substituents are present. The lowest numbers possible are given to substituents, choice between alternatives being governed by Rule **A-2** so far as applicable, except that when names are based on those of compounds listed in Part **1** of this rule the first priority for lowest numbers is given to the substituent(s) already present in those compounds.

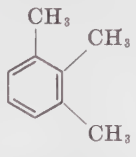


Examples:

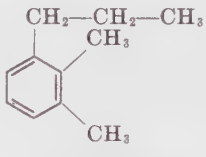
1-Ethyl-4-pentylbenzene or *p*-Ethylpentylbenzene



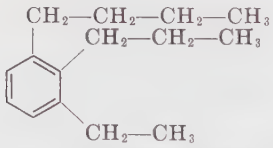
1,4-Diethylbenzene or *p*-Diethylbenzene



4-Ethylstyrene or *p*-Ethylstyrene



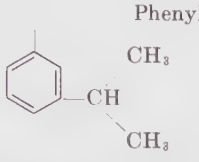
Chemical Abstracts limits the use of *o-*, *m-* and *p-* to like substituents when both are expressed as prefixes, *e.g.*, *p*-diethylbenzene, 1-ethyl-4-pentylbenzene. However, when one substituent is expressed in the name, *m-*, *o-* or *p-* is used to indicate the position of the second and different substituent, *e.g.*, *o*-ethylcumene.



1,4-Divinylbenzene or *p*-Divinylbenzene, not *p*-Vinylstyrene

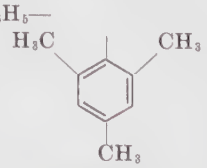
1,2,3-Trimethylbenzene, not Methylxylene nor Dimethyltoluene

1,2-Dimethyl-3-propylbenzene or 3-Propyl-*o*-xylene



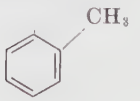
1-Ethyl-2-propyl-3-butylbenzene (Order of complexity)
or 1-Butyl-3-ethyl-2-propylbenzene (Alphabetical order)

12.4.—The generic name of monocyclic and polycyclic aromatic hydrocarbons is "arene."

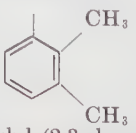


A-13

13.1.—Univalent radicals derived from monocyclic aromatic hydrocarbons and having the free valence at a ring atom are given the names listed below. Such radicals not listed below are named as substituted phenyl radicals. The carbon atom having the free valence is numbered as 1.



Phenyl C_6H_5—



Cumenyl (*m*-shown)

Mesityl

Tolyl (*o*-shown)

Xylyl (2,3-shown)

13.2.—Since the name phenylene (*o*-, *m*-, or *p*-) is retained for the radical —C_6H_4— (exception to Rule **A-11.6**) bivalent radicals formed from substituted benzene derivatives and having the free valences at ring atoms are named as substituted phenylene radicals. The carbon atoms having the free valences are numbered 1,2-, 1,3-, or 1,4- as appropriate.

13.3.—These trivial names for radicals having a single free valence in the side chain are retained:

Benzyl	$C_6H_5—\overset{\alpha}{C}H_2—$
Cinnamyl	$C_6H_5—\overset{\gamma}{C}H=\overset{\beta}{C}H—\overset{\alpha}{C}H_2—$
Phenethyl	$C_6H_5—\overset{\beta}{C}H_2—\overset{\alpha}{C}H_2—$
Styryl	$C_6H_5—\overset{\beta}{C}H=\overset{\alpha}{C}H—$
Trityl	$(C_6H_5)_3C—$

Chemical Abstracts limits trityl to the unsubstituted radical.

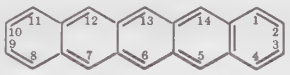
13.4.—Multivalent radicals of aromatic hydrocarbons with free valences in the side chain are named in accordance with Rule **A-4.**

Examples:

Benzylidyne	$C_6H_5—C=$
Cinnamylidene	$C_6H_5—\overset{\gamma}{C}H=\overset{\beta}{C}H—\overset{\alpha}{C}H=$

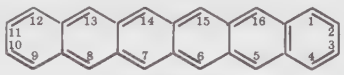
A-14

14.1.—The generic names of univalent and bivalent aromatic hydrocarbon radicals are "aryl" and "arylene," respectively.



Fused Polycyclic Hydrocarbons

A-21

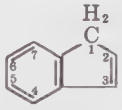


21.1.—The names of polycyclic hydrocarbons with maximum number of non-cumulative[1] double bonds end in "-ene." The names listed on pp. 11 and 12 are retained.

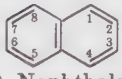
21.2.—The names of hydrocarbons containing five or more fused benzene rings in a straight linear arrangement are formed from a numerical prefix as specified in Rule **A-1.1** followed by "-acene."

Examples:

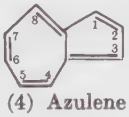
Pentacene



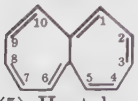
Hexacene



The following list contains the names of polycyclic hydrocarbons which are retained (see Rule **A-21.1**).

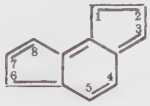


(1) Pentalene

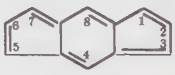


(2) Indene

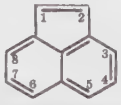
(3) Naphthalene



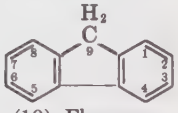
(4) Azulene



(5) Heptalene



(6) Biphenylene

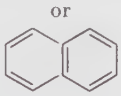


(7) *as*-Indacene

(8) *s*-Indacene

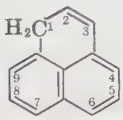
(9) Acenaphthylene

(10) Fluorene

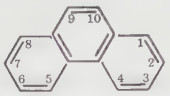


(1) Cumulative double bonds are those present in a chain in which at least three contiguous carbon atoms are joined by double bonds; non-cumulative double bonds comprise every other arrangement of two or more double bonds in a single structure. The generic name "cumulene" is given to compounds containing three or more cumulative double bonds.

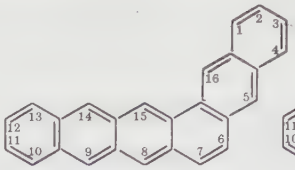
$CH_2=C=C=C=CH_2$



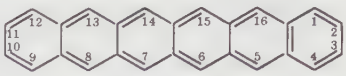
Cumulative

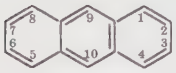


$CH_3—CH=CH—CH=CH—CH=CH_2$

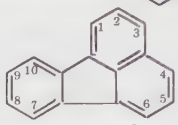


or

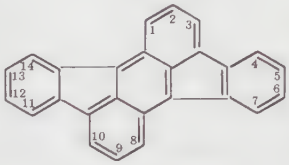




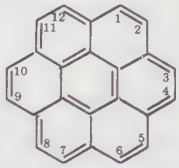
Non-cumulative



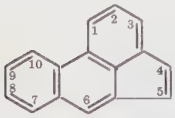
(11) Phenalene



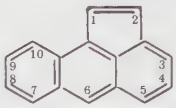
(12) Phenanthrene[1]



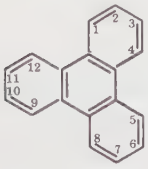
(27) Hexaphene



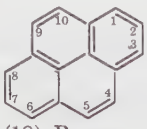
(28) Hexacene[2]



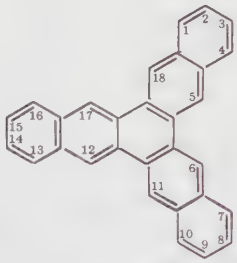
(13) Anthracene[1]



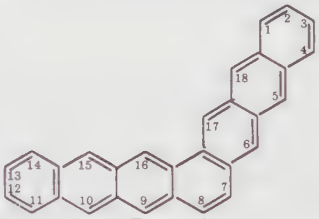
(14) Fluoranthene



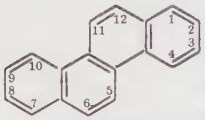
(29) Rubicene



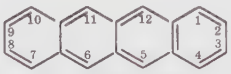
(30) Coronene



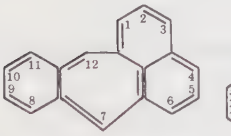
(15) Acephenanthrylene



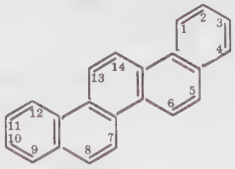
(16) Aceanthrylene



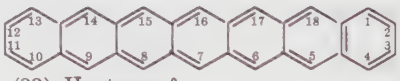
(17) Triphenylene



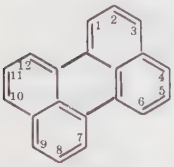
(18) Pyrene



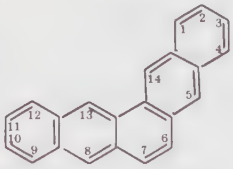
(31) Trinaphthylene[3]



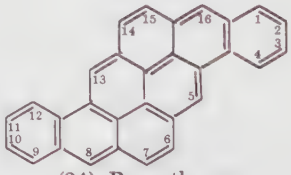
(32) Heptaphene



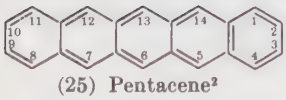
(19) Chrysene



(20) Naphthacene

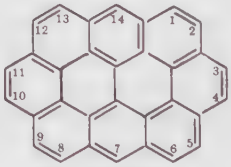


(21) Pleiadene



(22) Picene

(33) Heptacene[2]



(23) Perylene

(24) Pentaphene

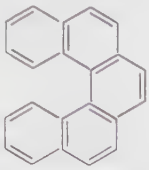
(34) Pyranthrene

(25) Pentacene[2]

(26) Tetraphenylene[3]

(35) Ovalene

Beginning with Volume 51 Subject Index *Chemical Abstracts* uses biphenylene in place of cyclobutadibenzene and phenalene in place of benzonaphthene. The polycyclic hydrocarbons which have the trivial names listed above may be used as the base components in naming orthofused or ortho- and peri-fused polycyclic systems for which there are no acceptable trivial names.



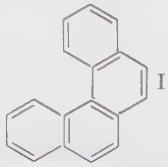
(1) Denotes exception to systematic numbering. See Rule **A-22.5.**

(2) See Rule **A-21.2.**

(3) For isomer shown only.

21.3.—"Ortho-fused"[4] or "ortho- and peri-fused"[5] polycyclic hydrocarbons with maximum number of noncumulative double bonds which contain at least two rings of five or more members and which have no accepted trivial name such as those of **21.1** of this Rule, are named by prefixing to the name of a component ring or ring system (the base component) designations of the other components. The base component should contain as many rings as possible (provided it has a trivial name), and should occur as far as possible from the beginning of the list of Rule **A-21.1.** The attached components should be as simple as possible.

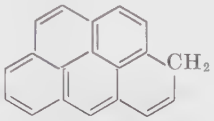
Example:



Dibenzophenanthrene

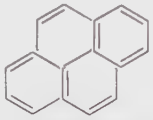
(not Naphthophenanthrene; benzo is "simpler" than naphtho, even though there are two benzo rings and only one naphtho)

(4) Polycyclic compounds in which two rings have two, and only two, atoms in common are said to be "ortho-fused." Such compounds have n common faces and $2n$ common atoms (Example I).



(5) Polycyclic compounds in which one ring contains two, and only two, atoms in common with each of two or more rings of a contiguous series of rings are said to be "ortho- and peri-fused." Such compounds have n common faces and fewer than $2n$ common atoms (Examples II and III).

Examples:



I

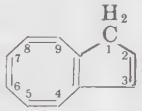
3 common faces
6 common atoms
"Ortho-fused" system

II

7 common faces
8 common atoms

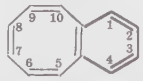
III

5 common faces
6 common atoms



"Ortho- and peri-fused" systems

21.4.—The prefixes designating attached components are formed by changing the ending "-ene" of the name of the component hydrocarbon into "-eno," *e.g.*, "pyreno" (from pyrene). When more than one prefix is present, they are arranged in alphabetical order. These common abbreviated prefixes are recognized (see list in **21.1** of this Rule)



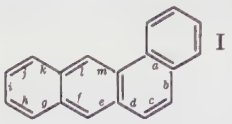
Acenaphtho	from	Acenaphthylene
Anthra	from	Anthracene
Benzo	from	Benzene
Naphtho	from	Naphthalene
Perylo	from	Perylene
Phenanthro	from	Phenanthrene

For monocyclic prefixes other than "benzo-," the following names are recognized, each to represent the form with the maximum number of non-cumulative double bonds: cyclopenta, cyclohepta, cycloocta, cyclonona, *etc.* When the base component is a monocyclic system, the ending "-ene" signifies the maximum number of noncumulative double bonds, and does not denote one double bond only.

Examples:

1*H*-Cyclopentacycloöctene

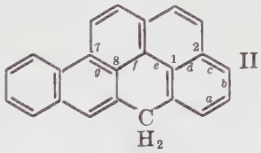
Benzocycloöctene



In forming names of polycyclic systems from the above carbocyclic prefixes the final "o" or "a" of the prefix is elided before another vowel, except in the case of anthra, phenanthro and prefixes ending in -eno from which the "a" and "o" are never elided. Examples: benz[*a*]anthracene, cyclopent[*a*]acenaphthylene, anthra[1,2 − *a*]anthracene, fluoreno[4,3,2-*de*]anthracene.

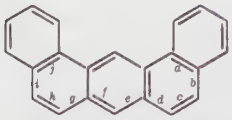
The ending "-ene" to signify the maximum number of noncumulative double bonds in all fused carbocyclic systems means that the endings -diene, triene, tetraene, *etc.*, are unnecessary when the base component is a monocyclic ring of seven or more carbon atoms. Higher stages of hydrogenation are indicated by the use of the prefixes dihydro-, tetrahydro-, *etc.* (*cf.* Rule **A-23.1**). *Chemical Abstracts* follows Rules **A-21.4** and **A-23.1** instead of Alternate Rule **A-23.5.**

21.5.—Isomers are distinguished by lettering the peripheral sides of the base component *a*, *b*, *c*, *etc.*, beginning with "*a*" for the side "1,2," "*b*" for "2,3" (or in certain cases "2,2a") and lettering every side around the periphery. To the letter as early in the alphabet as possible, denoting the side where fusion occurs, are prefixed, if necessary, the numbers of the positions of attachment of the other component. These numbers are chosen to be as low as is consistent with the numbering of the component, and their order conforms to the direction of lettering of the base component (see Examples II and IV). When two



or more prefixes refer to equivalent positions so that there is a choice of letters, the prefixes are cited in alphabetical order according to Rule **A-21.4** and the location of the first cited prefix is indicated by a letter as early as possible in the alphabet (see Example V). The numbers and letters are enclosed in brackets and placed immediately after the designation of the attached component. This expression merely defines the manner of fusion of the components.

Examples:

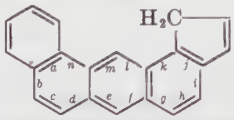


I

Benz[*a*]anthracene

II

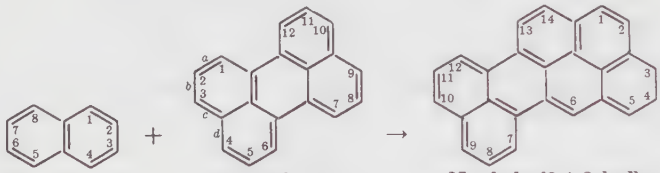
6*H*-Naphtho[2,1,8,7-*defg*]-naphthacene



III

Dibenz[*a*,*j*]anthracene
(not Naphtho[2,1-*b*]phenanthrene)

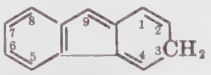
IV



Indeno[1,2-*a*]indene

V

1*H*-Benzo[*a*]cyclopent[*j*]anthracene

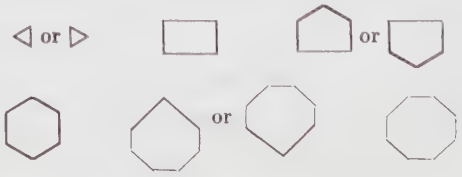


The completed system consisting of the base component and the other components is then renumbered according to Rule **A-22,** the numbering of the component parts being ignored.

Naphthalene + Perylene → Naphtho[8,1,2-*bcd*]-perylene

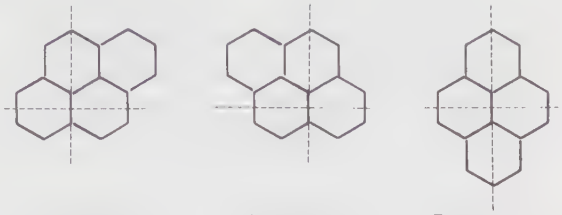
21.6.—When a name applies equally to two or more isomeric condensed parent ring systems with the maximum number of non-cumulative double bonds and when the name can be made specific by indicating the position of one or more hydrogen atoms in the structure, this is accomplished by modifying the name with a locant, followed by italic capital *H* for each of these hydrogen atoms. Such symbols ordinarily precede the name. The said atom or atoms are called "indicated hydrogen." The same principle is applied to radicals and compounds derived from these systems.

Examples:



3*H*-Fluorene

2*H*-Indene



A-22

22.1.—For the purposes of numbering, the individual rings of a polycyclic "ortho-fused" or "ortho- and peri-fused" hydrocarbon system usually are drawn as follows:

and the polycyclic system is oriented so that (a) the greatest number of rings are in a horizontal row and (b) a maximum number of rings are above and to the right of the horizontal row (upper right quadrant).

If two or more orientations meet these requirements, the one is chosen which has as few rings as possible in the lower left quadrant.

Correct orientation | Incorrect orientation | Incorrect orientation

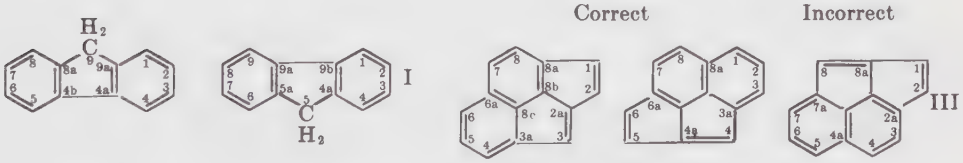
The system thus oriented is numbered in a clockwise direction commencing with the carbon atom not engaged in ring-fusion in the most counterclockwise position of the uppermost ring, or if there is a choice, of the uppermost ring farthest to the right, and omitting atoms common to two or more rings.

Correct | Incorrect

22.2.—Atoms common to two or more rings are designated by adding roman letters "a," "b," "c," *etc.*, to the number of the position immediately preceding. Interior atoms follow the highest number, taking a clockwise sequence wherever there is a choice.

Examples:

[*cf.* Note below]



Correct | Incorrect

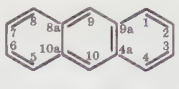
22.3.—When there is a choice, carbon atoms common to two or more rings follow the lowest possible numbers.

Examples:

Correct | Incorrect

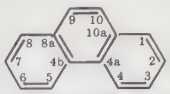
Correct | Incorrect | Correct | Incorrect

Note: I. 4, 4, 8, 9 is lower than 4, 5, 9, 9.
II. 2, 5, 8 is lower than 3, 5, 8.
III. 2, 3, 6, 8 is lower than 3, 4, 6, 8 or 2, 4, 7, 8.

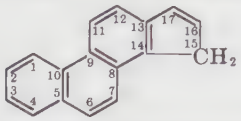


22.4.—When there is a choice, the carbon atoms which carry an indicated hydrogen atom are numbered as low as possible.

Examples:



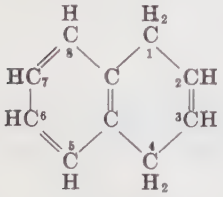
Correct | Incorrect



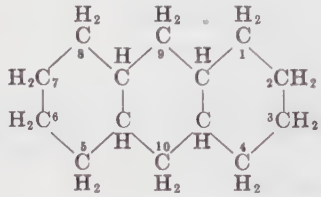
22.5.—The following are recommended exceptions to the above rules on numbering

Anthracene

Phenanthrene



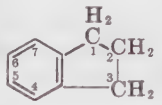
Cyclopenta[*a*]phenanthrene
(15*H*- shown)
See also rules on steroids



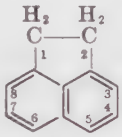
A-23

23.1.—The names of "ortho-fused" or "ortho- and peri-fused" polycyclic hydrocarbons with less than maximum number of non-cumulative double bonds are formed from a prefix "dihydro-," "tetrahydro-," *etc.*, followed by the name of the corresponding unreduced hydrocarbon. The prefix "perhydro-" signifies full hydrogenation. When there is a choice for *H* used for indicated hydrogen it is assigned the lowest available number.

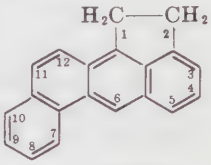
Examples:



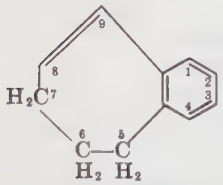
1,4-Dihydro-naphthalene



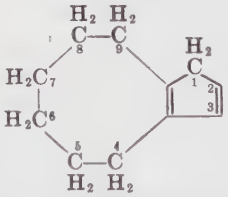
Perhydroanthracene



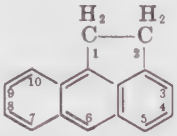
Exceptions: These names are retained



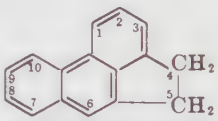
Indan



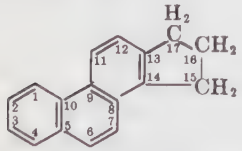
Acenaphthene



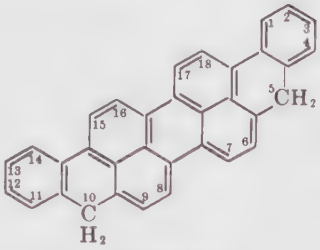
Cholanthrene



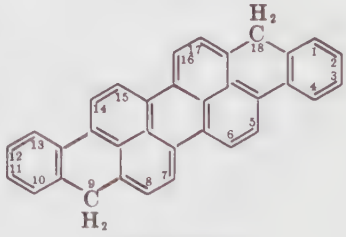
6,7-Dihydro-5*H*-benzo-cycloheptene



4,5,6,7,8,9-Hexahydro-1*H*-cyclopentacycloöctene



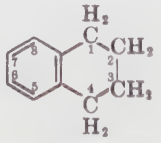
Aceanthrene



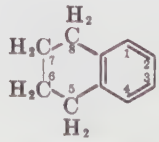
Acephenanthrene

16,17-Dihydro-15*H*-cyclopenta[*a*]phenanthrene

Violanthrene



Isoviolanthrene

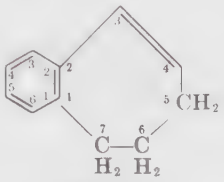


Chemical Abstracts follows this Rule instead of the alternate Rule 23.5.

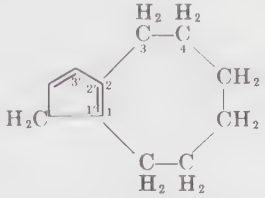
23.2.—When there is a choice, the carbon atoms to which hydrogen atoms are added are numbered as low as possible.

Example:

Correct

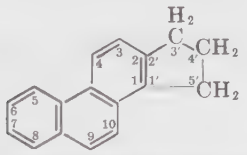


Incorrect



23.3.—Substituted polycyclic hydrocarbons are named according to the same principles as substituted monocyclic hydrocarbons (see Rules **A-12** and **A-61**).

23.5 (Alternate to part of Rule **A-23.1**).—The names of "ortho-fused" polycyclic hydrocarbons which have (a) less than the maximum number of non-cumulative double bonds, (b) at least one terminal unit which is most conveniently named as an unsaturated cycloalkane derivative, and (c) a double bond at the positions where rings are fused together, may be derived by joining the name of the terminal unit to that of the other component by means of a letter "o" with elision of a terminal "e". The abbreviations for fused aromatic systems laid down in Rule **A-21.4** are used, and the exceptions of Rule **A-23.1** apply.

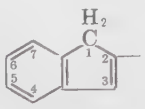


Examples:

1,2-Benzo-
1,3-cycloheptadiene

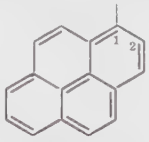
1,2-Cyclopenta-
1′,3′-dienocycloöctene

1,2-Cyclopentenophenanthrene



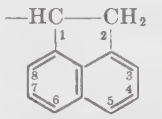
Chemical Abstracts follows Rules **A-21.4** and **A-23.1** instead of this alternate rule.

A-24



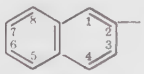
24.1.—For radicals derived from polycyclic hydrocarbons, the numbering of the hydrocarbon is retained. The point or points of attachment are given numbers as low as is consistent with the fixed numbering of the hydrocarbon.

24.2.—Univalent radicals derived from "ortho-fused" or "ortho- and peri-fused" polycyclic hydrocarbons with names ending in "-ene" by removal of a hydrogen atom from an aromatic or alicyclic ring are named in principle by changing the ending "-ene" of the names of the hydrocarbons to "-enyl."

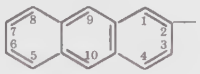


Examples:

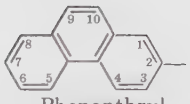
2-Indenyl



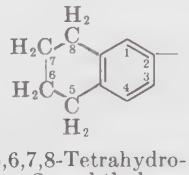
1-Pyrenyl



1-Acenaphthenyl



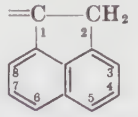
Exceptions:



Naphthyl
(2-shown)

Anthryl
(2-shown)

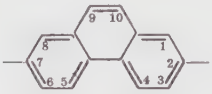
Phenanthryl
(2-shown)



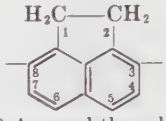
5,6,7,8-Tetrahydro-
2-naphthyl

The above exceptions are limited to the simple rings as shown. Radicals from names of fused derivatives of these rings are formed according to the Rule, *e.g.*, benz[*a*]anthracenyl.

24.3.—Bivalent radicals derived from univalent polycyclic hydrocarbon radicals whose names end in "-yl", by removal of one hydrogen atom from the carbon atom with the free valence are named by adding "-idene" to the name of the corresponding univalent radical.



Example:



1-Acenaphthenylidene

24.4.—Bivalent radicals derived from "ortho-fused" or "ortho- and peri-fused" polycyclic hydrocarbons by removing of a hydrogen atom from each of two different carbon atoms of the ring are named by changing the ending "-yl" of the univalent radical name to "-ylene."

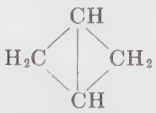
Examples:

2,7-Phenanthrylene

3,8-Acenaphthenylene

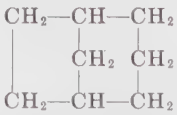
Chemical Abstracts names multivalent radicals with three or more free valences derived from polycyclic hydrocarbons by an extension of Rule **B-5.13** to carbocyclic systems. Example: 1,4,5-anthracenetriyl.

A-28



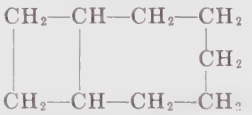
28.1.—Radicals formed from hydrocarbons consisting of polycyclic systems and side chains are named according to the principles of the preceding rules.

Bridged Hydrocarbons



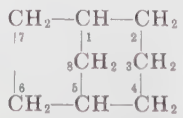
A-31. von Baeyer System

31.1.—Saturated alicyclic hydrocarbon systems consisting of two rings only, having two or more atoms in common, take the name of an open chain hydrocarbon containing the same total number of carbon atoms preceded by the prefix "bicyclo-." The number of carbon atoms in each of the three bridges[1] connecting the two tertiary carbon atoms is indicated in brackets in descending order.

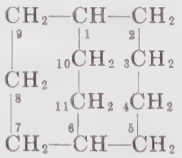


Examples:

Bicyclo [1.1.0]-butane



Bicyclo [3.2.1]-octane

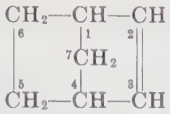


Bicyclo [5.2.0]nonane

31.2.—The system is numbered commencing with one of the bridge-heads, numbering proceeding by the longest possible path to the second bridge-head; numbering is then continued from this atom by the longer unnumbered path back to the first bridge-head and is completed by the shortest path.

Examples:

Bicyclo [3.2.1]octane

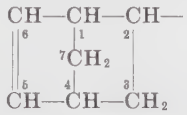


Bicyclo [4.3.2]undecane

Note: Longest path 1, 2, 3, 4, 5
Next longest path 5, 6, 7, 1
Shortest path 1, 8, 5

(1) A bridge is a valence bond or an atom or an unbranched chain of atoms connecting two different parts of a molecule. The two tertiary carbon atoms connected through the bridge are termed "bridge-heads."

31.3.—Unsaturated hydrocarbons are named in accordance with the principles set forth in Rule **A-11.3.** When there is a choice in numbering unsaturation is given the lowest numbers.



Bicyclo [2.2.1]hept-2-ene

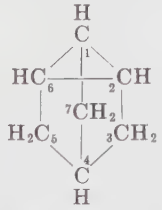
Chemical Abstracts names the above ring system 2-norbornene by Rule **A-74.2,** but follows the above Rule for hydrocarbons which do not have terpene names.

31.4.—Radicals derived from these hydrocarbons are named in accordance with the principles set forth in Rule **A-11.4.** The numbering of the hydrocarbon is retained and the point or points of attachment are given numbers as low as is consistent with the fixed numbering of the hydrocarbon.

Example:

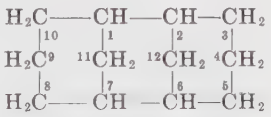
Bicyclo[2.2.1]hept-5-en-2-yl

Chemical Abstracts names the above radical 5-norbornen-2-yl by Rule **A-75.2,** but follows the above Rule for radicals derived from hydrocarbons which do not have terpene names. Radicals derived from the saturated hydrocarbons (except terpenes) are named by replacing the ending "-ane" of the hydrocarbon name by ,"-yl." The point of attachment is given a number as low as is consistent with the fixed numbering of the hydrocarbon.



A-32

32.11.—Cyclic hydrocarbon systems consisting of three or more rings may be named in accordance with the principles stated in Rule **A-31.** The appropriate prefix "tricyclo-," "tetracyclo-," *etc.*, is substituted for "bicyclo-" before the name of the open-chain hydrocarbon containing the same total number of carbon atoms.



32.12.—A polycyclic system is regarded as containing a number of rings equal to the number of scissions required to convert the system into an open-chain compound.

32.13.—The word "cyclo" is followed by brackets containing, in decreasing order, numbers indicating the number of carbon atoms in: the two branches of the main ring, the main bridge, the secondary bridges.

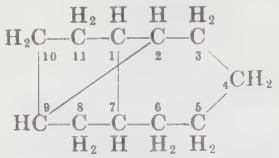
Examples:

Tricyclo[2.2.1.0^{1}]heptane

Tricyclo[5.3.1.1^{1}]dodecane

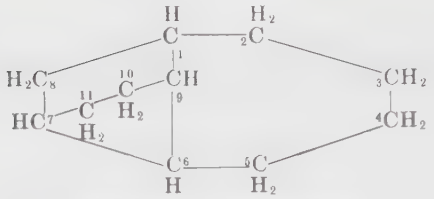
(1) For location and numbering of the secondary bridge see Rules **A-32.22. A32.23, A-32.31.**

32.21.—The main ring and the main bridge form a bicyclic system whose numbering is made in compliance with Rule **A-31.**



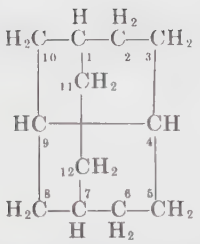
32.22.—The location of the other or so-called secondary bridges is shown by superscripts following the number indicating the number of carbon atoms in the said bridges.

32.23.—For the purpose of numbering, the secondary bridges are considered in decreasing order. The numbering of any bridge follows from the part already numbered, proceeding from the highest-numbered bridge-head.

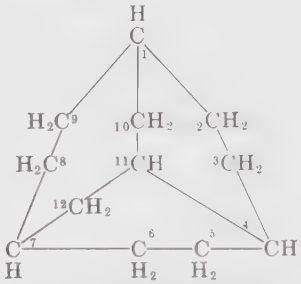


Numbering of the secondary bridges by proceeding from the highest-numbered bridge-head of each bridge is an improvement over the former practice of "following the shortest path from the highest previous number."

32.31.—When there is a choice, the following criteria are considered in turn until a decision is made:

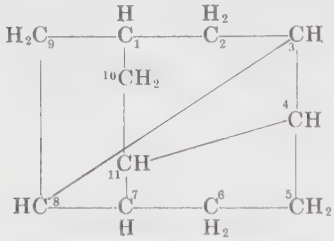


(a) The main ring shall contain as many carbon atoms as possible, two of which must serve as bridgeheads for the main bridge.

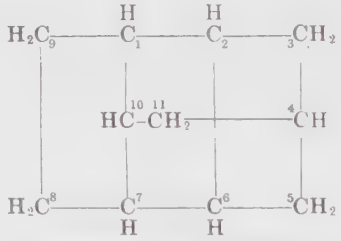


Tricyclo[5.4.0.0^{2,9}]undecane
Correct numbering

Tricyclo[4.2.1.2^{7,9}]undecane
Incorrect numbering

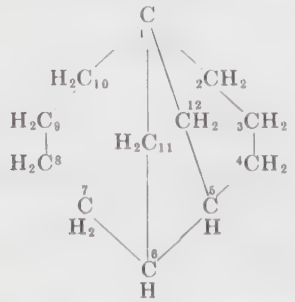


Tricyclo[5.3.2.0^{4,9}]dodecane
Correct numbering

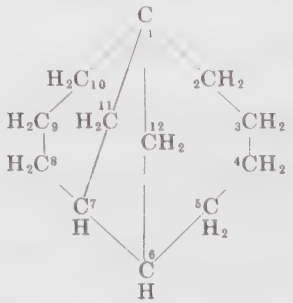


Tricyclo[5.2.3.0^{4,11}]dodecane
Incorrect numbering

(b) The main bridge shall be as large as possible.

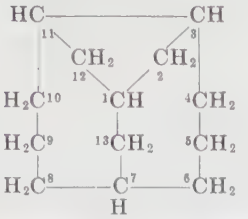


Tetracyclo[5.2.2.0^{3,8}.0^{4,11}]-undecane
Correct numbering

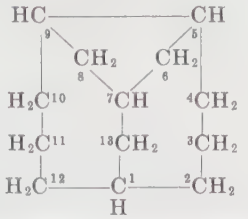


Tetracyclo[5.2.1.1^{4,10}.0^{2,6}]-undecane
Incorrect numbering

(c) The main ring shall be divided as symmetrically as possible by the main bridge.



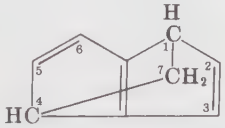
Tricyclo[4.4.1.1^{1,5}]dodecane:
Correct numbering



Tricyclo[5.3.1.1^{1,6}]dodecane:
Incorrect numbering

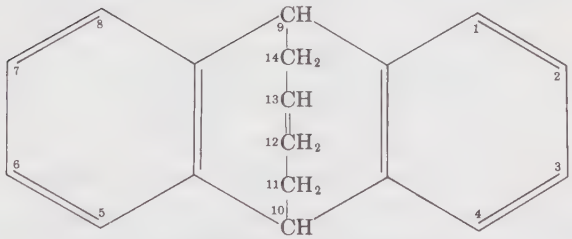
(d) The superscripts locating the other bridges shall be as small as possible (in the sense indicated in Rule **A-2.2**)

Tricyclo[5.5.1.$0^{3,11}$]tridecane
Correct numbering



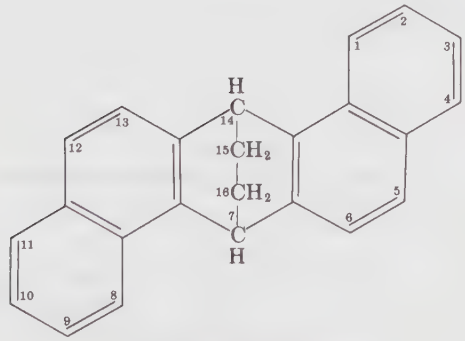
Tricyclo[5.5.1.$0^{5,9}$]tridecane
Incorrect numbering

A-34 (Alternate to Rule A-35)



34.1.—Polycyclic hydrocarbon systems which can be regarded as "ortho-fused" or "ortho- and peri-fused" systems according to Rule **A-21** and which, at the same time, have other bridges,[1] are first named as "ortho-fused" or "ortho- and peri-fused" systems. The other bridges are then indicated by prefixes derived from the corresponding hydrocarbon by replacing the final "-ane," "-ene," *etc.*, by "-ano," "-eno," *etc.*, and their positions are indicated by the points of attachment in the parent compound. If bridges of different types are present, they are cited in alphabetical order.

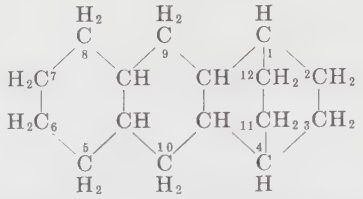
Examples of bridge names



Butano	—CH_2—CH_2—CH_2—CH_2—	Etheno	—CH=CH—
Benzeno (*o*-, *m*-, *p*-)	—C_6H_4—	Methano	—CH_2—
Ethano	—CH_2—CH_2—	Propano	—CH_2—CH_2—CH_2—

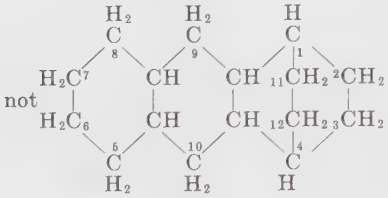
1,4-Dihydro-1,4-methanopentalene

9,10-Dihydro-9,10-(2-buteno)-anthracene



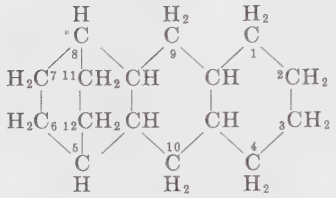
7,14-Dihydro-7,14-ethano-dibenz[*a*,*h*]anthracene

(1) The term "bridge," when used in connection with an "ortho-fused" or "ortho- and peri-fused" polycyclic system as defined in note to Rule **A-31.1**, also includes "bivalent cyclic systems."



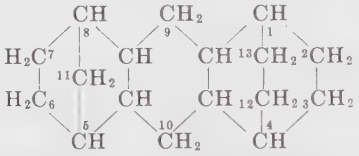
34.2.—The parent "ortho-fused" "or ortho- and peri-fused" system is numbered as prescribed in Rule **A-22.** Where there is a choice, the position numbers of the bridge-heads should be as low as possible. The remaining bridges are then numbered in turn starting each time with the bridge atom next to the bridge-head possessing the highest number.

Example:

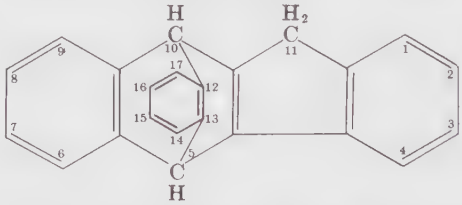


Perhydro-1,4-ethanoanthracene

not



or



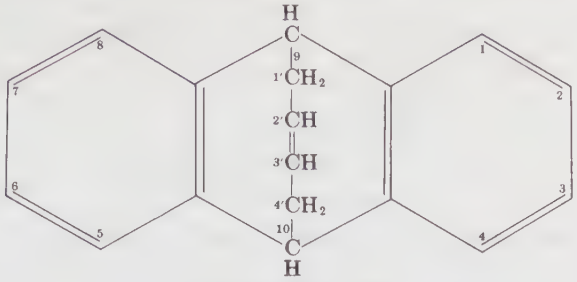
34.3.—When there is a choice of position numbers for the points of attachment for several individual bridges, the lowest numbers are assigned to the bridge-heads in the order of citation of the bridges and the bridge atoms are numbered according to the preceding rule.

Example:

Perhydro-1,4-ethano-5,8-methanoanthracene

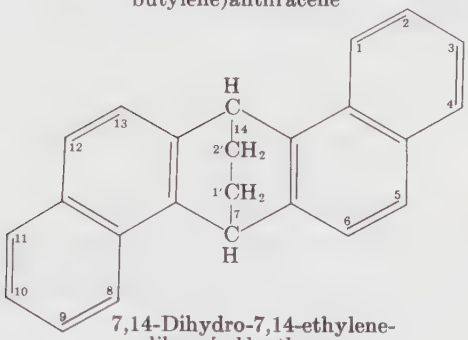
34.4.—When the bridge is formed from a bivalent cyclic hydrocarbon radical, low numbers are given to the carbon atoms constituting the shorter bridge and numbering proceeds around the ring.

10,11-Dihydro-5,10-*o*-benzeno-5*H*-benzo[*b*]fluorene



Chemical Abstracts follows this rule instead of the Alternate Rule **A-35.**

A-35 (Alternate to Rule A-34)

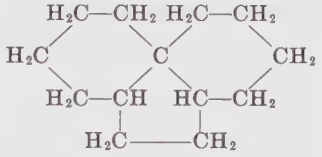


35.1.—Polycyclic hydrocarbons which can be regarded as "ortho-fused" or "ortho- and peri-fused" according to Rule **A-21** and which have also other bridges may be named as "ortho-fused" or "ortho- and peri-fused" systems into which bivalent radicals are substituted.

35.2.—Compounds which are named in accordance with **35.1** of this rule are numbered as prescribed in Rule **A-34.** The bridge is numbered independently. Numbering of the bridge is started at the lower-numbered bridge head. Numbers assigned to the bridge atoms are primed.

Examples:

9,10-Dihydro-9,10-(2′-butylene)anthracene

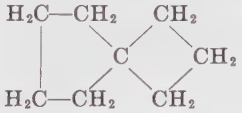


7,14-Dihydro-7,14-ethylene-dibenz[*a*,*h*]anthracene

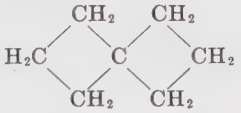
Chemical Abstracts follows Rule **A-34** instead of this Alternate Rule.

Spiro Hydrocarbons

A "spiro union" is one formed by a single atom which is the only common member of two rings. A "free spiro union" is one constituting the only union direct or indirect between two rings.[1] The common atom is designated as the "spiro atom." According to the number of spiro atoms present, the compounds are distinguished as monospiro, dispiro, trispiro compounds, *etc.* The following rules apply to the naming of compounds containing free spiro unions.



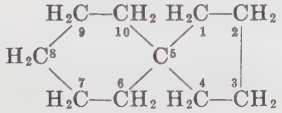
(1) An example of a compound where the spiro union is *not* free is:



A-41 (Alternate to Rule A-42)

41.1.—Monospiro compounds consisting of only two alicyclic rings as components are named by placing "spiro" before the name of the normal acyclic hydrocarbon of the same total number of carbon atoms. The number of carbon atoms linked to the spiro atom in each ring is indicated in ascending order in brackets placed between the spiro prefix and the hydrocarbon name.

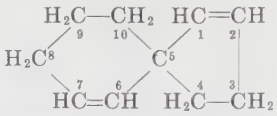
Examples:



Spiro[3.4]octane

Spiro[3.3]heptane

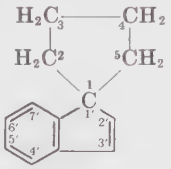
41.2.—The carbon atoms in monospiro hydrocarbons are numbered consecutively starting with a ring atom next to the spiro atom, first through the smaller ring (if such be present) and then through the spiro atom and around the second ring.



Example:

Spiro[4.5]decane

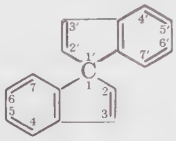
41.3.—When unsaturation is present, the same numbering pattern is maintained, but in such a direction around the rings that the double and triple bonds receive numbers as low as possible in accordance with Rule **A-11.**



Example:

Spiro[4.5]deca-1,6-diene

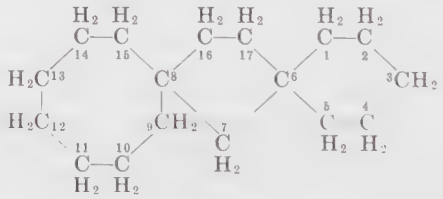
41.4.—If one or both components of the monospiro compound are fused polycyclic systems, "spiro" is placed before the names of the components arranged in alphabetical order and enclosed in brackets. Established numbering of the individual components is retained. The lowest possible number is given to the spiro atom, and the numbers of the second component are marked with primes. The position of the spiro atom is indicated by placing the appropriate numbers between the names of the two components.



Example:

Spiro[cyclopentane-1,1′-indene]

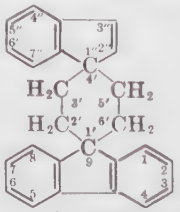
41.5.—Monospiro compounds containing two similar polycyclic components are named by placing the prefix "spirobi" before the name of the component ring system. Established numbering of the polycyclic system is maintained and the numbers of one component are distinguished by primes. The position of the spiro atom is indicated in the name of the spiro compound by placing the appropriate locants before the name.



Example:

1,1′-Spirobiindene

41.6.—Polyspiro compounds consisting of three or more alicyclic systems are named by placing "dispiro-," "trispiro-," "tetraspiro-," *etc.*, before the name of the normal acyclic hydrocarbon of the same total number of carbon atoms. The numbers of carbon atoms linked to the spiro atoms in each ring are indicated in brackets in the same order as the numbering proceeds about the ring. Numbering starts with a ring atom next to a terminal spiro atom and proceeds in such a way as to give the spiro atoms as low numbers as possible.

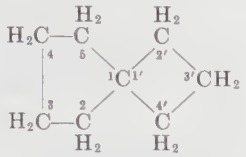


Example:

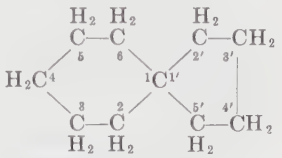
Dispiro[5.1.7.2]heptadecane

41.7.—Polycyclic compounds containing more than one spiro atom and at least one fused polycyclic component are named in accordance with **41.4** of this rule by replacing "spiro" with "dispiro," "trispiro," etc., and choosing the end components by alphabetical order.

Example:

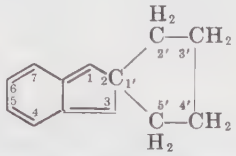


Dispiro[fluorene-9,1′-cyclohexane-4′,1″-indene]



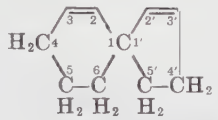
This represents the method of naming spiro compounds which is followed by *Chemical Abstracts* instead of the Alternate Rule **A-42.**

42.1 (Alternate to **A-41.1** and **A-41.2**).—When two dissimilar cyclic components are united by a spiro union the name of the larger component is followed by the affix "spiro" which, in turn, is followed by the name of the smaller component. Between the affix "spiro" and the name of each component system is inserted the number denoting the spiro-position in the appropriate ring system, these numbers being as low as permitted by any fixed numbering of the component. The components retain their respective numberings but numbers for the component mentioned second are primed. Numbers 1 may be omitted when a free choice is available for a component.



Examples:

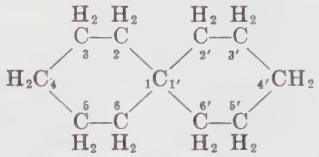
Cyclopentanespiro-cyclobutane



Cyclohexanespirocyclo-pentane

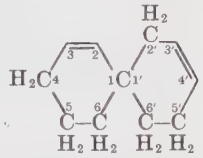
2*H*-Indene-2-spiro-1′-cyclopentane

42.2 (Alternate to **A-41.3**).—Rule **A-41.3** applies also with appropriate different numbering where nomenclature is according to Rule **A-42.1**, but the spiro-junction has priority for lowest numbers over unsaturation.



Example:

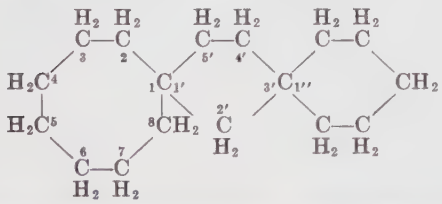
2-Cyclohexenespiro-(2′-cyclopentene)



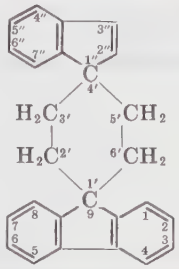
42.3 (Alternate to **A-41.5**).—The nomenclature of Rule **A-41.5** is applied also to monocyclic components with identical saturation, the spiro-union being numbered 1.

Examples:

Spirobicyclohexane



but



2-Cyclohexenespiro-(3′-cyclohexene)

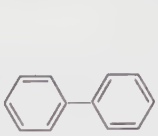
42.4 (Alternate to **A-41.6** and **A-41.7**).—Polycyclic compounds containing more than one spiro atom are named in accordance with Rule **A-42.1** starting from the senior[1] end-component irrespective of whether the components are simple or fused rings.

Examples:

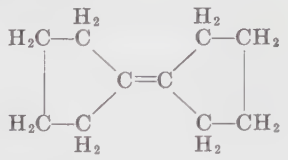
Cycloöctanespirocyclopentane-3′-spirocyclohexane

Fluorene-9-spiro-1′-cyclohexane-4′-spiro-1″-indene

(1) "Seniority" in respect to spiro compounds is based on the principles: (i) an aggregate is senior to a monocycle; (ii) of aggregates, the senior is that containing the largest number of individual rings; (iii) of aggregates containing the same number of individual rings, the senior is that containing the largest ring; (iv) if aggregates consist of equal number of equal rings the senior is the first occurring in the alphabetical list of names.



Chemical Abstracts follows Rule **A-41** instead of this alternate Rule.



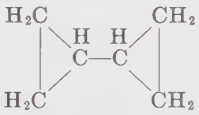
Hydrocarbon Ring Assemblies

A-51

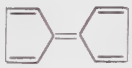
51.1.—Two or more cyclic systems (single rings or fused systems) which are directly joined to each other by double or single bonds are named "ring assemblies" when the number of such direct ring junctions is one less than the number of cyclic systems involved.

Examples:

Ring assemblies



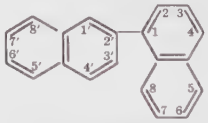
Fused polycyclic system



A-52

52.1.—Assemblies of two identical cyclic hydrocarbon systems are named in either of two ways: (a) by placing the prefix "bi-" before the name of the corresponding radical, or (b) for systems joined by a single bond by placing the prefix "bi-" before the name of the corresponding hydrocarbon. In each case, the numbering of the assembly is that of the corresponding radical or hydrocarbon, one system being assigned unprimed numbers and the other primed numbers. The points of attachment are indicated by placing the appropriate locants before the name.

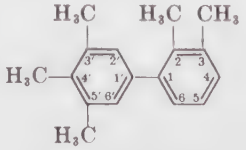
Examples:



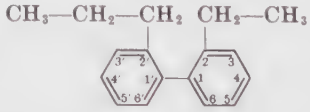
1,1′-Bicyclopropyl
or 1,1′-Bicyclopropane

1,1′-Bicyclopentadienylidene

52.2.—If there is a choice in numbering, unprimed numbers are assigned to the system which has the lower-numbered point of attachment.



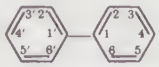
Example:



1,2′-Binaphthyl
or 1,2′-Binaphthalene

52.3.—If two identical hydrocarbon systems have the same point of attachment and contain substituents at different positions, the locants of these substituents are assigned according to Rule **A-2.2**; for this purpose an unprimed number is considered lower than the same number when primed. Assemblies of primed and unprimed numbers are arranged in ascending numerical order.

Examples:

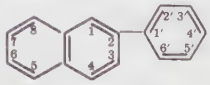


2,3,3′,4′,5′-
Pentamethylbiphenyl
(not 2′,3,3′,4,5-
Pentamethylbiphenyl)

2-Ethyl-2′-
propylbiphenyl

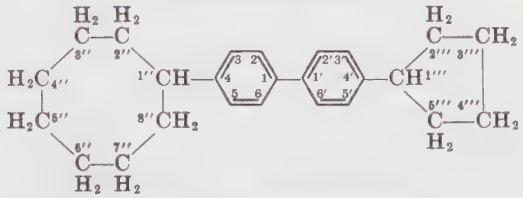
52.4.—The name "biphenyl" is used for the assembly consisting of two benzene rings:

Biphenyl



A-53

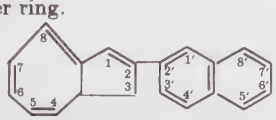
53.1.—Other hydrocarbon ring assemblies are named by selecting one ring system as the base component and considering the other system as substituents of the base component. Such substituents are arranged in alphabetical order. The base component is assigned unprimed numbers and the substituents are assigned numbers with primes.



53.2.—The base component is chosen by considering these characteristics in turn until a decision is reached:

(a) The system containing the larger number of rings.

Examples:

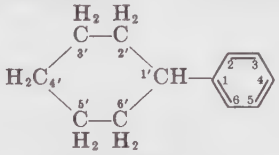


2-Phenylnaphthalene

4-Cycloöctyl-4′-cyclopentylbiphenyl

(b) The system containing the larger ring.

Examples:

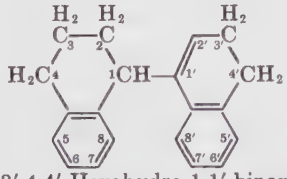


2-(2′-Naphthyl)azulene

1,4-Dicyclopropylbenzene
or *p*-Dicyclopropylbenzene

(c) The system in the lowest state of hydrogenation (see also **53.3** of this rule).

Example:



Cyclohexylbenzene

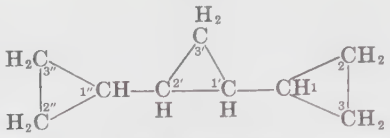
(d) The order of ring systems as set forth in the list of Rule **A-21.1.**

53.3.—Compounds covered by **53.2**(c) of this rule may also be named as hydrogenation products according to Rule **A-23.**

Example:

1,2,3,3′,4,4′-Hexahydro-1,1′-binaphthyl

The name of the second example in (a) which contains as a base component the ring assembly "biphenyl" indicates that the word system as used here includes ring assemblies as base components.

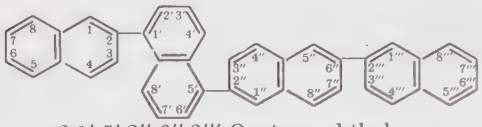


Chemical Abstracts does not use primed numbers with the groups which may be considered as substituent groups expressed as prefixes and attached to the name of the base component, Examples: 2-(2,4-dichlorophenyl)naphthalene; 2(2-naphthyl)-azulene.

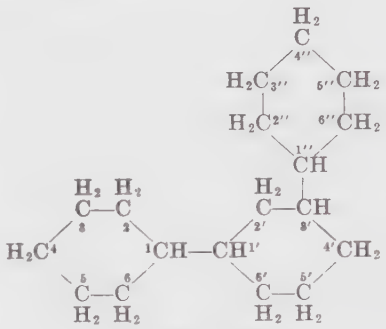
A-54

54.1.—Unbranched assemblies consisting of three or more identical hydrocarbon ring systems are named by placing an appropriate numerical prefix before the name of the hydrocarbon corresponding to the repetitive unit. These numerical prefixes are used:

3. ter-	5. quinque-	7. septi-	9. novi-
4. quater-	6. sexi-	8. octi-	10. deci-



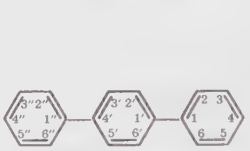
Example:



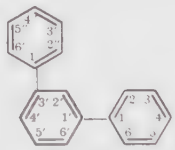
Tercyclopropane

54.2.—Unprimed numbers are assigned to one of the terminal systems, the other systems being primed serially. Points of attachment are assigned the lowest numbers possible.

Examples:



2,1′:5′,2″:6″,2‴-Quaternaphthalene



1,1′:3′,1″-Tercyclohexane

54.3.—As exceptions, unbranched assemblies consisting of benzene rings are named by using the appropriate prefix with the radical name "phenyl."

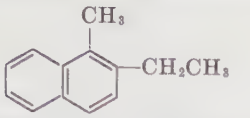
Examples:

p-Terphenyl
or 1,1′:4′,1″-Terphenyl

m-Terphenyl
or 1,1′:3′,1″-Terphenyl

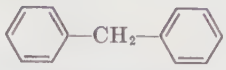
Cyclic Hydrocarbons with Side Chains

(Note: *cf.* Rules **A-12** and **A-13**)



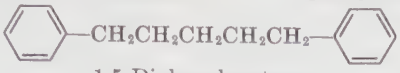
A-61

61.1.—Hydrocarbons more complex than those envisioned in Rule **A-12**, composed of cyclic nuclei and aliphatic chains, are named according to one of the methods given below. Choice is made so as to provide the name which is the simplest permissible or the most appropriate for the chemical intent.

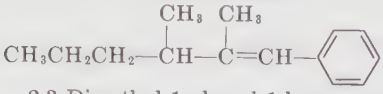


61.2.—When there is no generally recognized trivial name for the hydrocarbon, then (1) the radical name denoting the aliphatic chain is prefixed to the name of the cyclic hydrocarbon, or (2) the radical name for the cyclic hydrocarbon is prefixed to the name of the aliphatic compound. Choice between these methods is made according to the more appropriate of the following principles: (a) the maximum number of substitutions into a single unit of structure; (b) treatment of a smaller unit of structure as a substituent into a larger.

61.3.—In accordance with the principle (a) of **61.2** of this rule, hydrocarbons containing several chains attached to one cyclic nucleus generally are named as derivatives of the cyclic compound; and compounds containing several side chains and/or cyclic radicals attached to one chain are named as derivatives of the acyclic compound.

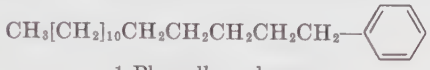


Examples:

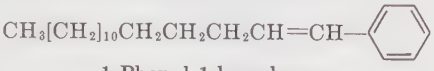


2-Ethyl-1-methylnaphthalene

Diphenylmethane

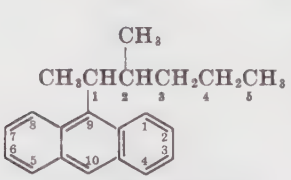


1,5-Diphenylpentane

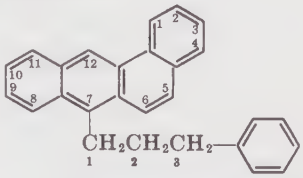


2,3-Dimethyl-1-phenyl-1-hexene

61.4.—In accordance with principle (b) of **61.2** of this rule, a hydrocarbon containing a small cyclic nucleus attached to a long chain is generally named as a derivative of the acyclic hydrocarbon; and a hydrocarbon containing a small group attached to a large cyclic nucleus is generally named as a derivative of the cyclic hydrocarbon.

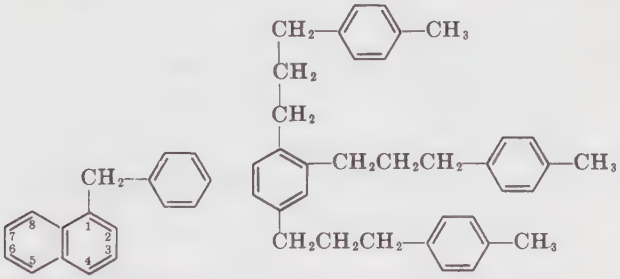


Examples:



1-Phenylhexadecane

1-Phenyl-1-hexadecene



9-(1,2-Dimethylpentyl)-anthracene

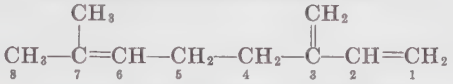
7-(3-Phenylpropyl)-benz[*a*]anthracene

61.5.—Recognized trivial names for composite radicals are used if they lead to simplifications in naming.

Examples:

1-Benzylnaphthalene

1,2,4-Tris(3-*p*-tolylyropyl)benzene



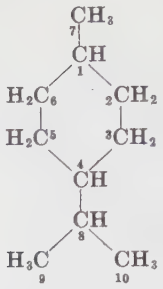
Terpene Hydrocarbons

Owing to long-established custom, terpenes are given exceptional treatment in these rules.

A-71. Acyclic Terpenes[1]

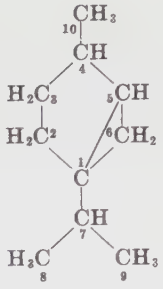
71.1.—The acyclic terpene hydrocarbons are named in a manner similar to that used for other unsaturated acyclic hydrocarbons when pure compounds are involved.

Example:



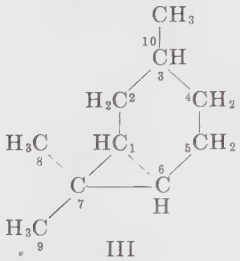
7-Methyl-3-methylene-1,6-octadiene

A-72. Cyclic Terpenes

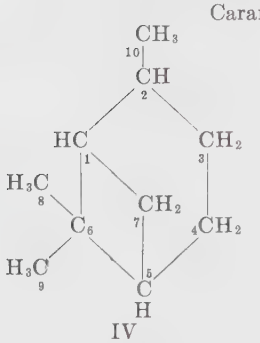


72.1.—The following structural types with their special names and special systems of numbering are used as the basis for the specialized nomenclature of monocyclic and bicyclic terpene hydrocarbons. The name "bornane" replaces camphane and bornylane; "norbornane" replaces norcamphane and norbornylane.

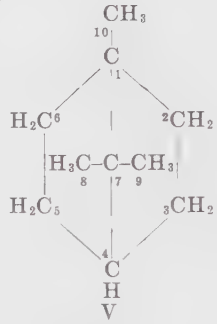
(1) For a more complete discussion of terpene nomenclature see "Nomenclature for Terpene Hydrocarbons," Advances in Chemistry Series No. 14 (American Chemical Society).



Fundamental terpene types:

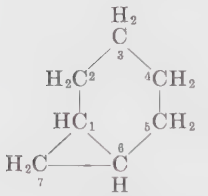


I
Menthane (*p*-form)

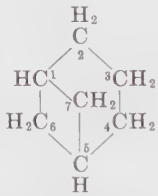


II
Thujane

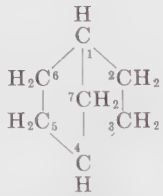
III
Carane



IV
Pinane



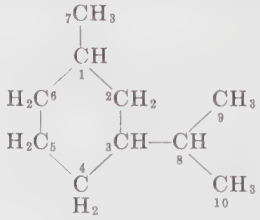
V
Bornane



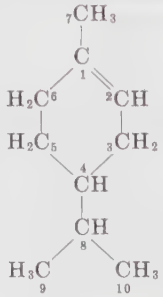
Nor-structures:

VI
Norcarane

VII
Norpinane

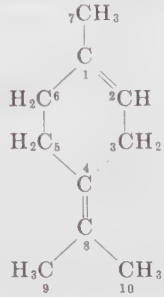


VIII
Norbornane



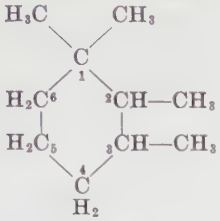
A-73. Monocyclic Terpenes

73.1.—Menthane Type: Monocyclic terpene hydrocarbons of this type (ortho, meta, and para isomers) are named menthane, menthene, menthadiene, *etc.*, are given the fixed numbering of menthane (Formula I). Such compounds substituted by additional alkyl groups are named in accordance with Rule **A-11.**

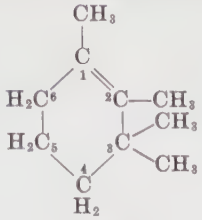


Examples:

m-Menthane

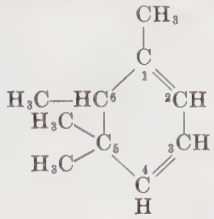


1-*p*-Menthene



1,4(8)-*p*-Menthadiene

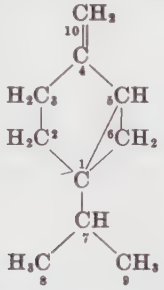
73.2.—Tetramethylcyclohexane Type: Monocyclic terpene hydrocarbons of this type are named systematically as derivatives of cyclohexane, cyclohexene, and cyclohexadiene (see Rule **A-11**).



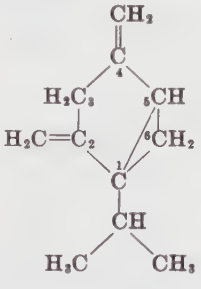
Examples:

1,1,2,3-Tetramethylcyclohexane

1,2,3,3-Tetramethylcyclohexene

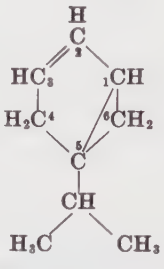


1,5,5,6-Tetramethyl-1,3-cyclohexadiene



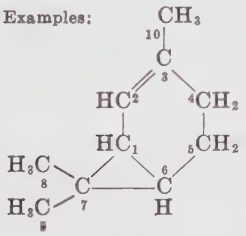
A-74. Bicyclic Terpenes

74.1.—Bicyclic terpene hydrocarbons having the skeleton of Formula II or this skeleton and additional side chains except methyl or isopropyl (or methylene if one methylene group is already present) are named as thujane, thujene, thujadiene, *etc.*, and are given the fixed numbering shown for thujane (Formula II). Other hydrocarbons containing the thujane ring-skeleton are named from bicyclo[3.1.0]hexane and are given systematic bicyclo numbering (*cf.* Rule **A-31**).

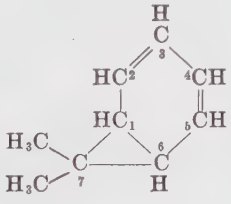


Example:

4(10)-Thujene

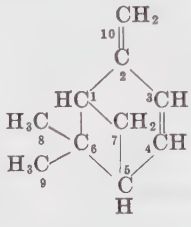


1-Isopropyl-2,4-dimethylenebicyclo-[3.1.0]hexane

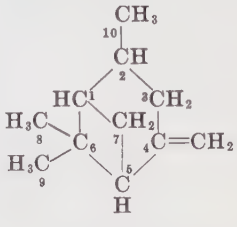


5-Isopropyl-bicyclo[3.1.0]hex-2-ene

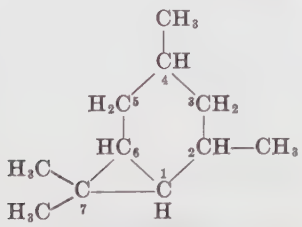
74.2.—Bicyclic terpene hydrocarbons having the skeleton of Formula III, IV, or V and additional side chains except methyl (or methylene if one methylene group is already present) are named, respectively, as carane, carene, caradiene, *etc.*; pinane, pinene, pinadiene, *etc.*; bornane, bornene, bornadiene, *etc.* They are given, respectively, the fixed numbering shown for carane (Formula III), pinane (Formula IV), and bornane (Formula V). Other hydrocarbons containing the ring-skeleton of carane, pinane, or bornane are named, respectively, from norcarane (Formula VI), norpinane (Formula VII), or norbornane (Formula VIII). These names are preferred to those from bicyclo [4.1.0]heptane, bicyclo[3.1.1]heptane, or bicyclo [2.2.1]heptane. The nor-names are given systematic bicyclo numbering (*cf.* Rule **A-31**).



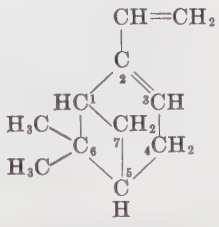
Examples:



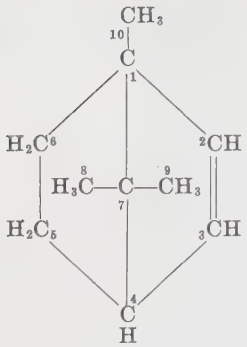
2-Carene



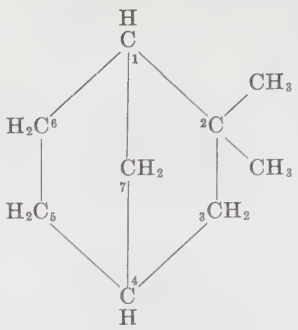
7,7-Dimethyl-2,4-norcaradiene



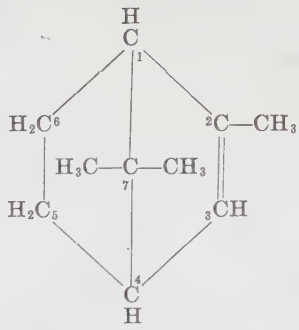
2(10),3-Pinadiene



4-Methylenepinane

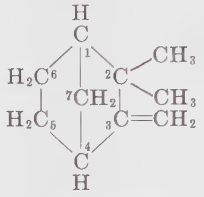


2,4,7,7-Tetramethylnorcarane



6,6-Dimethyl-2-vinyl-2-norpinene

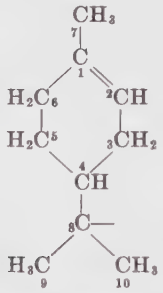
2-Bornene



2,2-Dimethylnorbornane

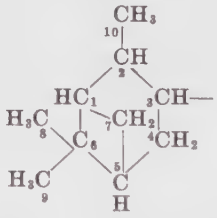
2,7,7-Trimethyl-2-norbornene

74.3.—The name "camphene" is retained for the unsubstituted compound 2,2-dimethyl-3-methylene-norbornane.



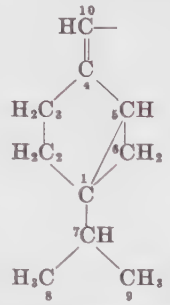
Camphene

A-75. Terpene Radicals

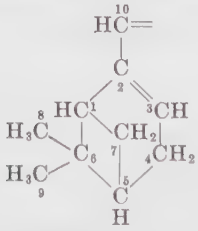


75.1.—Simple acyclic hydrocarbon terpene radicals are named and numbered according to Rule **A-3.5.** The trivial names geranyl, neryl, linalyl and phytyl are retained for the unsubstituted radicals.

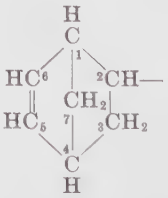
75.2.—Radicals derived from menthane, pinane, thujane, carane, bornane, norcarane, norpinane, and norbornane are named in accordance with the principles set forth in Rules **A-1.2** and **A-11.4** except that the saturated radicals of pinane are named pinanyl, pinanylene, and pinanylidene. The numbering of the hydrocarbon is retained and the point or points of attachment, whether in the ring or side chain, are given numbers as low as is consistent with the fixed numbering of the hydrocarbon.



Examples:



1-*p*-Menthen-8-yl



3-Pinanyl

4(10)-Thujen-10-yl

2-Pinen-10-ylidene

5-Norbornen-2-yl

75.3.—Radicals not named in Rules **A-75.1** and **A-75.2** are named as described in Rules **A-11** and **A-31.4.**

B. FUNDAMENTAL HETEROCYCLIC SYSTEMS

B-1. Extension of Hantzsch-Widman System

1.1.—Monocyclic compounds containing one or more hetero atoms in a three- to ten-membered ring are named by combining the appropriate prefix or prefixes from Table I (eliding "a" where necessary) with a stem from Table II. The state of hydrogenation is indicated either in the stem, as shown in Table II, or by the prefixes "dihydro-," "tetrahydro-," *etc.*, according to Rule **B-1.2.**

TABLE I

Element	Valence	Prefix
Oxygen	II	Oxa
Sulfur	II	Thia
Selenium	II	Selena
Tellurium	II	Tellura
Nitrogen	III	Aza
Phosphorus	III	Phospha[a]
Arsenic	III	Arsa[a]
Antimony	III	Stiba[a]
Bismuth	III	Bisma
Silicon	IV	Sila
Germanium	IV	Germa
Tin	IV	Stanna
Lead	IV	Plumba
Mercury	II	Mercura

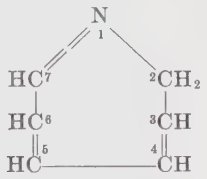
[a] When immediately followed by "in-" or "-ine," "phospha-" should be replaced by "phosphor-," "arsa-" should be replaced by "arsen-" and "stiba" should be replaced by "antimon-".

"Bora" for boron is used frequently. *Chemical Abstracts* has placed boron with the valence of III between lead and mercury in Table I. This table shows the valence of tin and lead as IV instead of II (a correction of a typographical error).

TABLE II

No. of members in the ring	Rings containing nitrogen		Rings containing no nitrogen	
	Unsaturation[a]	Saturation	Unsaturation[a]	Saturation
3	-irine	-iridine	-irene	irane[e]
4	-ete	-etidine	-ete	-etane
5	-ole	-olidine	-ole	-olane
6	-ine[b]	[c]	-ine[b]	-ane[d]
7	-epine	[c]	-epine	-epane
8	-ocine	[c]	-ocin	-ocane
9	-onine	[c]	-onin	-onane
10	-ecine	[c]	-ecin	-ecane

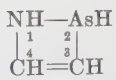
[a] Corresponding to the maximum number of non-cumulative double bonds, the hetero elements having the normal valences shown in Table I. [b] For phosphorus, arsenic, antimony, see the special provisions of Table I. [c] Expressed by prefixing "perhydro" to the name of the corresponding unsaturated compound. [d] Not applicable to silicon, germanium, tin and lead. In this case, "perhydro-" is prefixed to the name of the corresponding unsaturated compound. [e] The syllables denoting the size of rings containing 3, 4 or 7–10 members are derived as follows: "ir" from *tri-*, "et" from *tetra*, "ep" from *hepta*, "oc" from *octa*, "on" from *nona*, and "ec" from *deca*.



Examples:

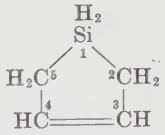
Oxirane

Aziridine



2*H*-Azepine

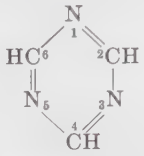
1.2.—Heterocyclic systems whose unsaturation is less than the one corresponding to the maximum number of noncumulative double bonds are named by using the prefixes "dihydro-," "tetrahydro-," etc.



In the case of 4- and 5-membered rings, a special termination is used for the structures containing one double bond, when there can be more than one noncumulative double bond.

No. of members of the partly saturated rings	Rings containing nitrogen	Rings containing no nitrogen
4	-etine	-etene
5	-oline	-olene

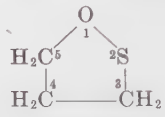
Examples:



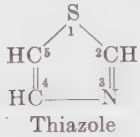
1,2-Azarset-3-ine

3-Silolene

1.3.—Multiplicity of the same hetero atom is indicated by a prefix "di," "tri-," etc., placed before the appropriate "a" term (Table I).



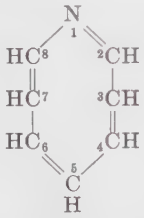
Example:



1,3,5-Triazine (or *s*-Triazine)

1.4.—If two or more kinds of "a" terms occur in the same name, their order of citation is by descending group number of the Periodic Table and increasing atomic number in the group as illustrated by the sequence in Table I.

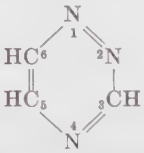
Examples:



1,2-Oxathiolane

Thiazole

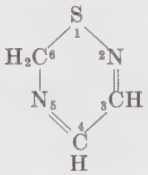
1.51.—The position of a single hetero atom determines the numbering in a monocyclic compound.



Example:

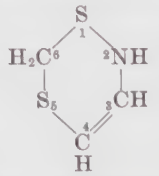
Azocine

1.52.—When the same hetero atom occurs more than once in a ring, the numbering is chosen to give the lowest locants to the hetero atoms.



Example:

1,2,4-Triazine (or *as*-Triazine)

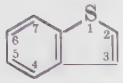


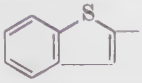
1.53.—When hetero atoms of different kinds are present, the locant 1 is given to a hetero atom which is as high as possible in Table I. The numbering is then chosen to give the lowest locants to the hetero atoms.

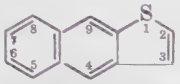
Examples:

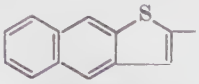
6*H*-1,2,5-Thiadiazine
(not 2,1,4-Thiadiazine)
(not 1,3,6-Thiadiazine)

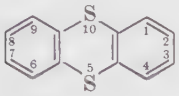
The numbering must begin with the sulfur atom. This condition eliminates 2,1,4-thiadiazine. Then the nitrogen atoms receive the lowest possible locant, which eliminates 1,3,6-thiadiazine.

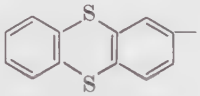


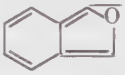


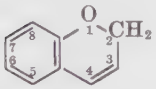


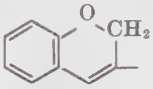


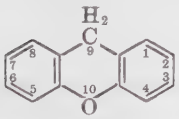


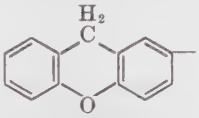


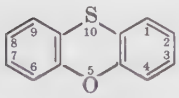


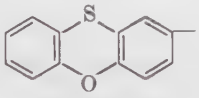


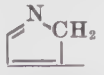


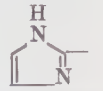


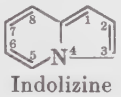


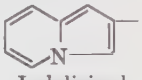


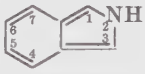


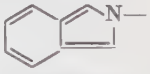






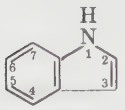


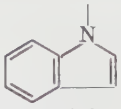


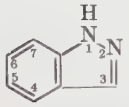


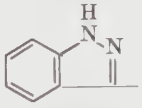
2*H*,6*H*-1,5,2-Dithiazine
(not 1,3,4-Dithiazine)
(not 1,3,6-Dithiazine)
(not 1,5,4-Dithiazine)

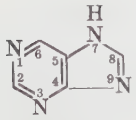
The numbering must begin with a sulfur atom. The choice of this atom is determined by the set of locants which can be attributed to the remaining hetero atoms of any kind. As the set 1,2,5 is lower than 1,3,4 or 1,3,6 or 1,5,4 in the usual sense, the name is 1,5,2-dithiazine.

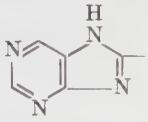


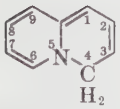


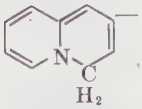


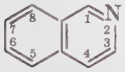


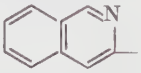


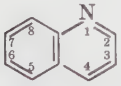


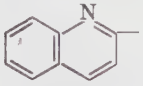


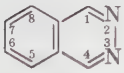


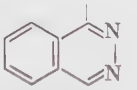


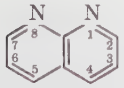


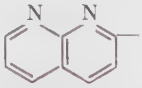


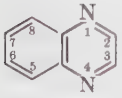


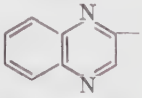


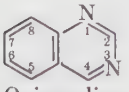


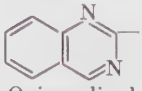




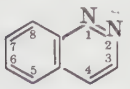


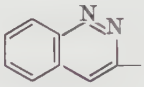


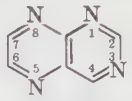


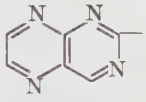


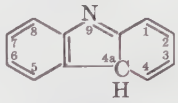
B-2. Trivial and Semi-trivial Names

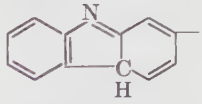


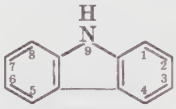


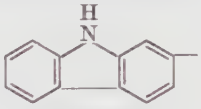


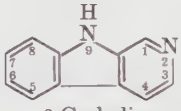


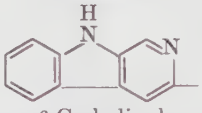


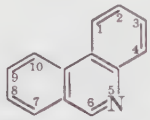


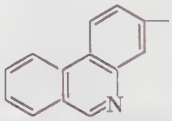


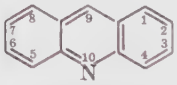


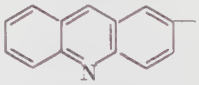


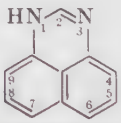


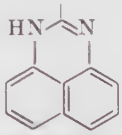


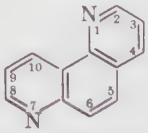


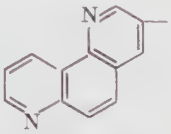












2.11.—The following trivial and semi-trivial names constitute a partial list of such names which are retained for the compound and as a basis of fusion names. They are arranged in the inverse order of the precedence prescribed in Rule **B-3.** The names of the radicals shown are formed according to Rule **B-5.**

	Parent Compound	Radical Name
(1)	 Thiophene	 Thienyl (2-shown)
(2)	 Benzo[*b*]thiophene (replacing thianaphthene)	 Benzo[*b*]thienyl (2-shown)
(3)	 Naphtho[2,3-*b*]thiophene (replacing thiophanthrene)	 Naphtho[2,3-*b*] thienyl (2-shown)
(4)	 Thianthrene	 Thianthrenyl (2-shown)
(5)	 Furan	 Furyl (3-shown)
(6)	 Pyran (2*H*-shown)	 Pyranyl (2*H*-Pyran-3-yl shown)
(7)	 Isobenzofuran	 Isobenzofuranyl (1-shown)
(8)	 Chromene (2*H*- shown)	 Chromenyl (2*H*-Chromen-3-yl shown)
(9)	 Xanthene[1]	 Xanthenyl[1] (2- shown)
(10)	 Phenoxathiin	 Phenoxathiinyl (2- shown)
(11)	 2*H*-Pyrrole	 2*H*-Pyrrolyl (2*H*-Pyrrol-3-yl shown)

	Parent Compound	Radical Name
(12)	 Pyrrole	 Pyrrolyl (3- shown)
(13)	 Imidazole	 Imidazolyl (2- shown)
(14)	 Pyrazole	 Pyrazolyl (1- shown)
(15)	 Pyridine	 Pyridyl (3- shown)
(16)	 Pyrazine	 Pyrazinyl
(17)	 Pyrimidine	 Pyrimidinyl (2-shown)
(18)	 Pyridazine	 Pyridazinyl (3- shown)
(19)	 Indolizine	 Indolizinyl (2-shown)
(20)	 Isoindole	 Isoindolyl (2- shown)
(21)	3*H*-Indole	3*H*-Indolyl (3*H*-Indol-2-yl shown)

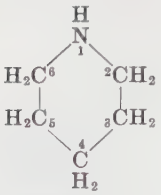
(1) Denotes exceptions to systematic numbering.

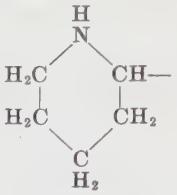
	Parent Compound	Radical Name
(22)	 Indole	 Indolyl (1- shown)
(23)	 1*H*-Indazole	 Indazolyl (1*H*-Indazol-3-yl shown)
(24)	 Purine[1]	 Purinyl[1] (8- shown)
(25)	 4*H*-Quinolizine	 4*H*-Quinolizinyl (4*H*-Quinolizin-2-yl shown)
(26)	 Isoquinoline	 Isoquinolyl (3- shown)
(27)	 Quinoline	 Quinolyl (2- shown)
(28)	 Phthalazine	 Phthalazinyl (1- shown)
(29)	 Naphthyridine (1,8- shown)	 Naphthyridinyl (1,8-Naphthyridin-2-yl shown)
(30)	 Quinoxaline	 Quinoxalinyl (2- shown)
(31)	 Quinazoline	 Quinazolinyl (2- shown)

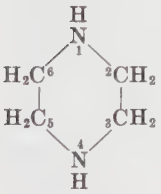
	Parent Compound	Radical Name
(32)	 Cinnoline	 Cinnolinyl (3- shown)
(33)	 Pteridine	 Pteridinyl (2- shown)
(34)	 4a*H*-Carbazole[1]	 4a*H*-Carbazolyl[1] (4a*H*-Carbazol-2-yl shown)
(35)	 Carbazole[1]	 Carbazolyl[1] (2- shown)
(36)	 β-Carboline	 β-Carbolinyl (β-Carbolin-3-yl shown)
(37)	 Phenanthridine	 Phenanthridinyl (3- shown)
(38)	 Acridine[1]	 Acridinyl[1] (2- shown)
(39)	 Perimidine	 Perimidinyl (2- shown)
(40)	 Phenanthroline (1,7- shown)	 Phenanthrolinyl (1,7-Phenanthrolin-3-yl shown)

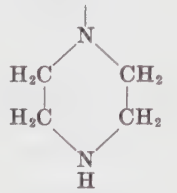
	Parent Compound	Radical Name
(41)	 Phenazine	 Phenazinyl (1- shown)
(42)	 Phenarsazine	 Phenarsazinyl (2- shown)
(43)	 Isothiazole	 Isothiazolyl (3- shown)

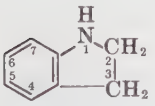
	Parent Compound	Radical Name
(44)	 Phenothiazine	 Phenothiazinyl (2- shown)
(45)	 Isoxazole	 Isoxazolyl (3- shown)
(46)	 Furazan	 Furazanyl (3- shown)
(47)	 Phenoxazine	 Phenoxazinyl (2- shown)

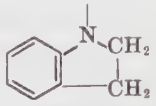


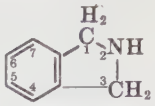


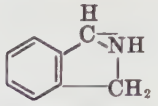


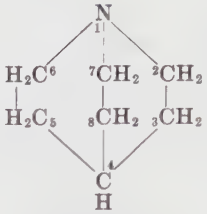


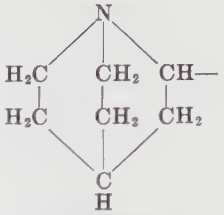


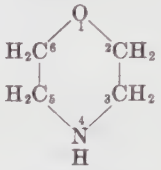


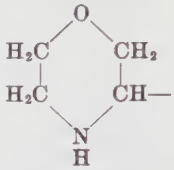












Chemical Abstracts uses 2*H*-1-benzopyran instead of chromene, and 9*H*-pyrido[3,4-*b*]indole instead of β-carboline.

B-2.12.—The following trivial and semi-trivial names are retained but are not recommended for use in fusion names. The names of the radicals shown are formed according to Rule **B-5.**

	Parent Compound	Radical Name
(1)	 Isochroman	 Isochromanyl (3- shown)
(2)	 Chroman	 Chromanyl (7- shown)
(3)	 Pyrrolidine	 Pyrrolidinyl (2- shown)
(4)	 Pyrroline (2- shown[1])	 Pyrrolinyl (2-Pyrrolin-3-yl[1] shown)

	Parent Compound	Radical Name
(5)	 Imidazolidine	 Imidazolidinyl (2- shown)
(6)	 Imidazoline (2- shown[1])	 Imidazolinyl (2-Imidazolin-4-yl[1] shown)
(7)	 Pyrazolidine	 Pyrazolidinyl (1- shown)
(8)	 Pyrazoline (3- shown[2])	 Pyrazolinyl (3-Pyrazolin-2-yl[2] shown)

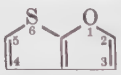
(1) The "2-" denotes the position of the double bond.
(2) The "3-" denotes the position of the double bond.
(3) For 1-piperidyl use piperidino.

	Parent Compound	Radical Name
(9)	 Piperidine	 Piperidyl[3] (2- shown)
(10)	 Piperazine	 Piperazinyl (1- shown)
(11)	 Indoline	 Indolinyl (1- shown)
(12)	 Isoindoline	 Isoindolinyl (1- shown)
(13)	 Quinuclidine	 Quinuclidinyl (2- shown)
(14)	 Morpholine	 Morpholinyl[1] (3- shown)

B-3. Fused Heterocyclic Systems

3.1.—"Ortho-fused" and "ortho- and peri-fused" ring compounds containing hetero atoms are named according to the fusion principle described in Rule **A-21** for hydrocarbons. The components are named according to Rules **A-21, B-1** and **B-2.** The base component should be a heterocycle. If there is a choice, the base component should be, by order of preference:

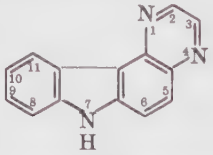
(a) A nitrogen-containing component.



Example:

Benzo[*h*]isoquinoline
not Pyrido[3,4-*a*]naphthalene

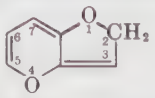
(b) A component containing a hetero atom (other than nitrogen) as high as possible in Table I.



Example:

Thieno[2,3-*b*]furan
not Furo[2,3-*b*]thiophene

(c) A component containing the greatest number of rings.

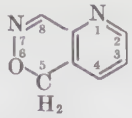


Example:

7*H*-Pyrazino[2,3-*c*]carbazole
not 7*H*-Indolo[3,2-*f*]quinoxaline

(d) A component containing the largest possible individual ring.

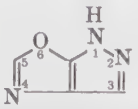
Example:



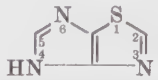
2*H*-Furo[3,2-*b*]pyran
not 2*H*-Pyrano[3,2-*b*]furan

(1) For 4-morpholinyl use morpholino.

(e) A component containing the greatest number of hetero atoms of any kind.



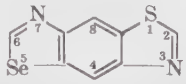
Example:



5*H*-Pyrido[2,3-*d*][1,2]oxazine
not [1,2]Oxazino[4,5-*b*]pyridine

(f) A component containing the greatest variety of hetero atoms.

Examples:

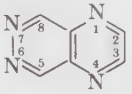


1*H*-Pyrazolo[4,3-*d*]oxazole
not 1*H*-Oxazolo[5,4-*c*]-
pyrazole

4*H*-Imidazo[4,5-*d*]thiazole
not 4*H*-Thiazolo[4,5-*d*]-
imidazole

(g) A component containing the greatest number of hetero atoms first listed in Table I.

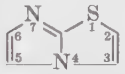
Example:



Selenazolo[5,4-*f*]benzothiazole[1]
not Thiazolo[5,4-*f*]benzoselenazole

(1) In this example the hetero atom first listed in Table I is sulfur and the greatest number of sulfur atoms in a ring is one.

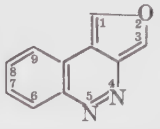
(h) If there is a choice between components of the same size containing the same number and kind of hetero atoms choose as the base component that one with the lower numbers for the hetero atoms before fusion.



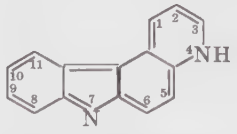
Example:

Pyrazino[2,3-*d*]pyridazine

3.2.—If a position of fusion is occupied by a hetero atom, the names of the component rings to be fused are so chosen as both to contain the hetero atom.



Example:

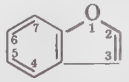


Imidazo[2,1-*b*]thiazole

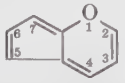
3.3.—These contracted fusion prefixes may be used: furo, imidazo, isoquino, pyrido, pyrimido, quino and thieno.

Examples:

Furo[3,4-*c*]cinnoline

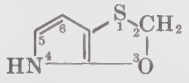


4*H*-Pyrido[2,3-*c*]carbazole



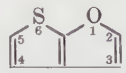
3.4.—In peripheral numbering of the complete fused systems, the ring system is oriented and numbered according to the principles of Rule **A-22.** When there is a choice of orientations, it is made in the following sequence in order to:

(a) Give low numbers to hetero atoms.



Examples:

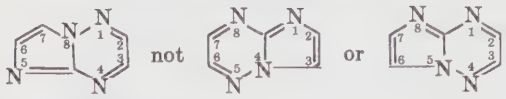
Benzo[*b*]furan



Cyclopenta[*b*]pyran

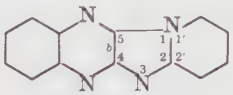
4*H*-[1,3]Oxathiolo-
[5,4-*b*]pyrrole (N.B.
1,3,4 lower than 1,3,6)

(b) Give low numbers to hetero atoms in order of Table I.



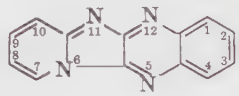
Example:

Thieno[2,3-*b*]furan

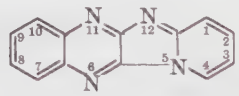


(c) Allow carbon atoms common to two or more rings to follow the lowest possible numbers (see Rules **A-22.2** and **A-22.3**). [A hetero atom common to the two rings is numbered according to Rule **B-3.4**(e).]

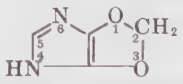
Examples:



Imidazo[1,2-*b*][1,2,4]triazine
(or Imidazo[1,2-*b*]-*as*-triazine)

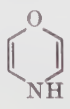


In a compound name for a fusion prefix (*i.e.*, when more than one pair of brackets is required), the points of fusion in the compound prefix are indicated by the use of unprimed and primed numbers, the unprimed numbers being assigned to the ring attached directly to the base component, thus



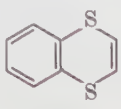
Pyrido[1′,2′:1,2]imidazo-
[4,5-*b*]quinoxaline

(d) Give hydrogen atoms lowest numbers possible.



4*H*-1,3-Dioxolo[4,5-*d*]imidazole

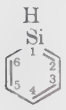
(e) The ring is numbered as for hydrocarbons but numbers are given to all hetero atoms even when common to two or more rings. Interior hetero atoms are numbered last following the shortest path from the highest previous number.

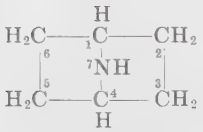


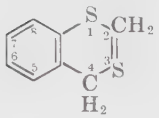
B-4. "a" Nomenclature

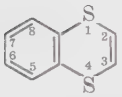
4.1.—Names of heterocyclic compounds also may be formed by prefixing "a" terms (see Table I of Rule **B-1.1**) to the name of the corresponding homocyclic compound. The letter "a" should not be elided. There are two methods of applying this principle:

4.1(a). Stelzner Method.—In this method, the "a" term name relates to that of the hydrocarbon with the same distribution of bonds in the rings. Thus, I is not so related to benzene but to 1,4-cyclohexadiene, and II is not so related to naphthalene but to 1,4-dihydronaphthalene.

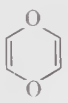


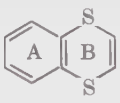


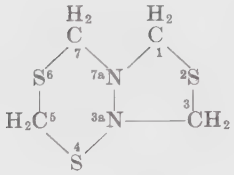


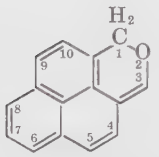


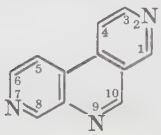
I











II

4.1(b). Chemical Abstracts Method.—If the corresponding homocyclic compound is partially or completely hydrogenated and if this state of hydrogenation is denoted in its name without the use of hydro prefixes, as indan and cyclohexane, the procedure is the same as in (a). In other cases, positions in the skeleton of the corresponding homocyclic compound which are occupied by hetero atoms are denoted by the "a" terms, and the parent heterocyclic compound is considered to be that which contains the maximum number of conjugated or isolated[1] double bonds; hydrogen is added, as necessary, as hydro prefixes and/or as *H* to the "a" name thus obtained.

Examples:

	Stelzner Method	*Chemical Abstracts* Method
	Sila-2,4-cyclopentadiene	Sila-2,4-cyclopentadiene
	Sila-1,3-cyclopentadiene	Sila-1,3-cyclopentadiene
	Silabenzene	Silabenzene
	7-Azabicyclo-[2.2.1]heptane	7-Azabicyclo-[2.2.1]heptane
	1,3-Dithia-1,2,3,4-tetrahydronaphthalene	4*H*-1,3-Dithianaphthalene
	1,4-Dithia-1,4-dihydronaphthalene	1,4-Dithianaphthalene

(1) Isolated double bonds are those which are neither conjugated nor cumulative as in  or the B ring of 

	Stelzner Method	*Chemical Abstracts* Method
	2,4,6-Trithia-3a,7a-diazaperhydroindene	2,4,6-Trithia-3a,7a-diazaindene
	2-Oxa-1,2-dihydropyrene	1*H*-2-Oxapyrene
	2,7,9-Triazaphenanthrene	2,7,9-Triazaphenanthrene

4.2.—In fusion names, the "a" terms precede the completed name of the parent hydrocarbon. If two or more kinds of "a" terms occur in the same name, the procedure described in Rule **B-1.4** applies. Prefixes denoting ordinary substitution procede the "a" terms.

Example:

3,4-Dimethyl-5-azabenz[*a*]anthracene

Chemical Abstracts follows Rule **B-4.1** (b). Since "a" names for heterocyclic systems are based on the name of the carbocyclic system, the numbering of the "a" name must agree with the numbering of the carbocyclic parent. When there is a choice in direction of numbering the ring is numbered so as to give (1) lowest numbers to the hetero atoms, (2) lowest numbers to hetero atoms as high as possible in Table 1 (Rule **B-1.1**).

B-5. Radicals

5.11.—Univalent radicals derived from heterocyclic compounds by removal of hydrogen from a ring are in principle named by adding "yl" to the names of the parent compounds (with elision of final "e" if present).

Examples:

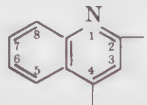
Indolyl from indole
Pyrrolinyl from pyrroline
Triazolyl from triazole
Triazinyl from triazine

(For further examples see Rule B-2.11).

These exceptions are retained: furyl, pyridyl, piperidyl, quinolyl, isoquinolyl and thienyl (from thiophene) (see also Rule **B-2.12**).

As exceptions, the names "piperidino" and "morpholino" are preferred to "1-piperidyl" and "4-morpholinyl."

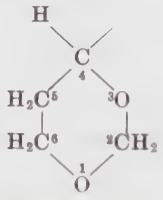
5.12.—Bivalent radicals derived from univalent heterocyclic radicals whose names end in "-yl" by removal of one hydrogen atom from the atom with the free valence are named by adding "-idene" to to the name of the corresponding univalent radical.



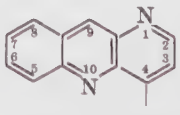
Example:

2-Pyranylidene

5.13.—Multivalent radicals derived from heterocyclic compounds by removal of two or more hydrogen atoms from different atoms in the ring are named by adding "-diyl," "-triyl," *etc.*, to the name of the ring system.



Example:

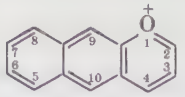


2,4-Quinolinediyl

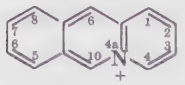
5.21.—The use of "a" terms (Rule **B-4**) does not affect the formation of radical names. Such names are strictly analogous to those of the hydrocarbon analogs except that the "a" terms establish numbering in whole or in part.

Examples:

1,3-Dioxa-4-cyclohexyl

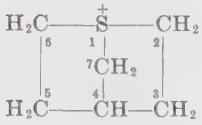


1,10-Diaza-4-anthryl

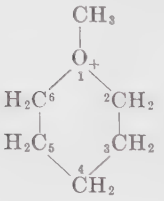


B-6. Cationic Hetero Atoms

6.1.—According to the "a" nomenclature, heterocyclic compounds containing cationic hetero atoms are named in conformity with the preceding rules by replacing "oxa-," "thia-," "aza-," *etc.*, by "oxonia-," "thionia-," "azonia-," *etc.*, the anion being designated in the usual way.



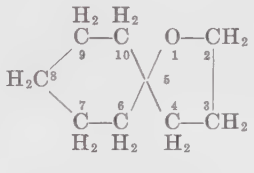
Examples:



Cl^- 1-Oxoniaanthracene chloride

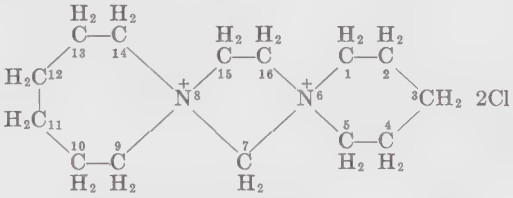
Cl^- 4a-Azoniaanthracene chloride

Cl^- 1-Thioniabicyclo[2.2.1]heptane chloride



Cl^- 1-Methyl-1-oxoniacyclohexane chloride

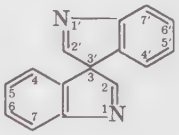
HETEROCYCLIC SPIRO COMPOUNDS



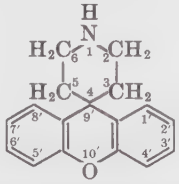
B-10 (Alternate to B-11)

10.1.—Heterocyclic spiro compounds containing single-ring units only may be named by prefixing "a" terms (see Table I, Rule **B-1.1**) to the names of the spiro hydrocarbons formed according to Rules **A-41.1, A-41.2, A-41.3** and **A-41.6.** The numbering of the spiro hydrocarbon is retained and the hetero atoms in the order of Table I are given as low numbers as are consistent with the fixed numbering of the ring. When there is a choice, hetero atoms are given lower numbers than double bonds.

Examples:



1-Oxaspiro[4.5]decane

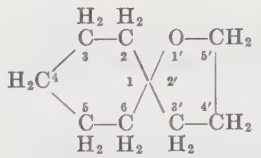


6,8-Diazoniadispiro[5.1.6.2]hexadecane dichloride

10.2.—If at least one component of a mono- or polyspiro compound is a fused polycyclic system, the spiro compound is named according to Rule **A-41.4** or **A-41.7,** giving the spiro atom as low a number as possible consistent with the fixed numberings of the component systems.

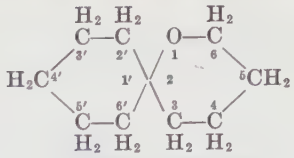
Examples:

3,3′-Spirobi[3*H*-indole]



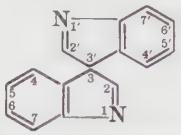
Spiro[piperidine-4,9′-xanthene]

Chemical Abstracts names heterocyclic spiro compounds according to Rules **B-10.1** and **B-10.2.**

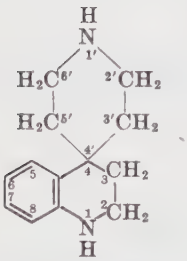


B-11 (Alternate to B-10)

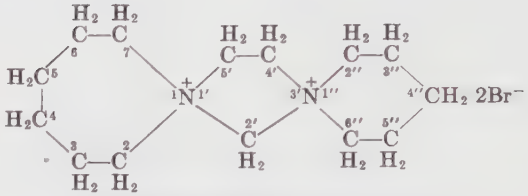
11.1.—Heterocyclic spiro compounds are named according to Rule **A-42,** the following criteria being applied where necessary: (a) spiro atoms have numbers as low as consistent with the numbering of the individual component systems; (b) heterocyclic components have priority over homocyclic components of the same size; (c) priority of heterocyclic components is decided according to Rule **B-3.** Parentheses are used where necessary for clarity in complex expressions.



Examples:



Cyclohexanespiro-2′-(tetrahydrofuran)



Tetrahydropyran-2-spirocyclohexane

3,3′-Spirobi(3*H*-indole)

1,2,3,4-Tetrahydroquinoline-4-spiro-4′-piperidine

Hexahydroazepinium-1-spiro-1′-imidazolidine-3′-spiro-1″-piperidinium dibromide

Chemical Abstract follows Rule **B-10.**

BRIDGED HETEROCYCLIC COMPOUNDS

Bridged heterocyclic bicyclo and polycyclo compounds are named by *Chemical Abstracts* by application of the "a" nomenclature to the names of bicyclo and polycyclo hydrocarbon systems which have been named according to Rules **A-31** and **A-32.**

Bridged heterocyclic compounds which can be regarded as ortho-fused or ortho- and peri-fused systems with additional bridges are named by extending Rule **A-34** to heterocyclic systems. Bridge names such as epoxy (—O—), epithio (—S—), epoxymethano (—O—CH_2—) are used.

INDEX

	RULE NO.
"a" Nomenclature	B-4
Acyclic hydrocarbons	A-1
Additive name	Glossary
Alkanes	A-1
Alkenes	A-3.1

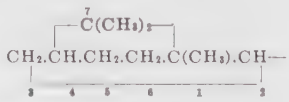
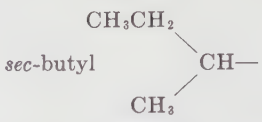
PREFIX NAMES OF ORGANIC RADICALS

This list is taken, by permission, from the Introduction to the Subject Index of *Chemical Abstracts*, Volumes 39 and 41.

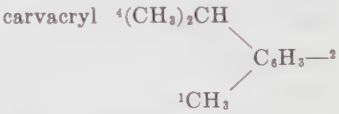
acenaphthenyl $C_{12}H_9$— (*from acenaphthene*)
acetamido CH_3CONH—
acetenyl = ethynyl
acetimido $CH_3C(:NH)$—
acetonyl CH_3COCH_2—
acetonylidene CH_3COCH=
acetoxy CH_3COO—
acetyl CH_3CO—
acetylene =CHCH=
acridyl $C_{13}H_8N$— (*from acridine*)
acrylyl CH_2:$CHCO$—
adipyl —$OC(CH_2)_4CO$—
alanyl CH_3CHNH_2CO—
alkoxy RO— (*R = any alkyl radical*)
allyl CH_2:$CHCH_2$—
β-allyl = isopropenyl
amino H_2N—(*properly, in acid groups only; by some used synonymously with amino*)
amidoxalyl = oxamyl
amino H_2N—
amoxy $CH_3(CH_2)_4O$—
amyl $CH_3(CH_2)_4$—



amylidene $CH_3(CH_2)_3CH$=
anilino C_6H_5NH—
anisal = anisylidene
anisoyl *p*-$CH_3OC_6H_4CO$—
anisyl = methoxyphenyl or methoxybenzyl
anisylidene p-$CH_3OC_6H_4CH$=
anthranoyl *o*-$H_2NC_6H_4CO$—
anthraquinonyl $C_{14}H_7O_2$— (*from anthraquinone, 2 isomers*)
anthryl $C_{14}H_9$— (*from anthracene, 3 isomers*)
anthrylene —$C_{14}H_8$— (*from anthracene, 14 isomers*)
antimono —Sb:Sb—
antipyroyl (*from antipyric acid*)



antipyryl (*from antipyrine*)



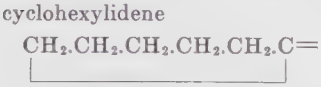
arseno —As:As—
arsenoso O:As—
arsinico (*from arsinic acid*) (HO)OAs=
arsino H_2As—
arso O_2As—
arsono (*from arsonic acid*) $(HO)_2OAs$—
arsylene HAs=
asaryl 2,4,5-$(CH_3O)_3C_6H_2$—
asparagyl $H_2NCOCH_2CHNH_2CO$—
aspartyl —$COCH_2CHNH_2CO$—
auro Au—
azido N_3—
azino =NN=.
azo —N:N— (*as connective*)
azoxy —N(O)N—
benzal = benzylidene
benzamido C_6H_5CONH—
benzenyl = benzylidyne
benzidino $H_2NC_6H_4C_6H_4NH$— (*from benzidine*)
benziloyl $(C_6H_5)_2C(OH)CO$—
benzimidazolyl $C_7H_5N_2$— (*from benzimidazole*)
benzimido $C_6H_5C(:NH)$—
benzofuryl C_8H_5O— (*from benzofuran*)
benzhydryl $(C_6H_5)_2CH$—
benzhydrylidene $(C_6H_5)_2C$=
benzopyranyl C_9H_7O— (2-α-, etc.) (*from benzopyran*)
benzoxazolyl C_7H_4NO— (*from benzoxazole*)
benzoxy C_6H_5COO—
benzoyl C_6H_5CO—
benzoylene —C_6H_4CO—
benzyl $C_6H_5CH_2$—
benzylidene C_6H_5CH=
benzylidyne C_6H_5C≡
biphenylene —$C_6H_4C_6H_4$—
biphenylenebisazo —N:$NC_6H_4C_6H_4N$:N—
biphenylyl (2-, 3- or 4-) $C_6H_5C_6H_4$— (*from biphenyl*)
biphenylycarbonyl $C_6H_5C_6H_4CO$—
biphenylyloxy $C_6H_5C_6H_4O$—
bornyl (*from borneol*)

boryl O:B—
bromo Br—
1-butenyl CH_3CH_2CH:CH—
2-butenyl CH_3CH:$CHCH_2$—
3-butenyl CH_2:$CH(CH_2)_2$—
butoxy $CH_3(CH_2)_3O$—
butyl $CH_3(CH_2)_3$—

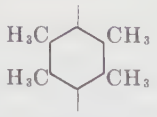
tert-butyl $(CH_3)_3C$—
butylene (1,4) = tetramethylene
butylidene $CH_3(CH_2)_2CH$=
butyryl $CH_3(CH_2)_2CO$—
camphanyl $C_{10}H_{17}$— (*from camphane, 3 isomers*)
camphoroyl $C_{10}H_{14}O_2$= (*from camphoric acid*)
camphoryl $C_{10}H_{15}O$— (*from camphor*)
camphorylidene $C_{10}H_{14}O$= (*from camphor*)
caproyl $CH_3(CH_2)_4CO$—
capryl $CH_3(CH_2)_6CO$—
caprylyl $CH_3(CH_2)_6CO$—
carbamido = ureido
carbamyl H_2NCO—
carbanilino = phenylcarbamyl
carbazolyl $C_{12}H_8N$— (*from carbazole, 5 isomers*)
carbethoxy C_2H_5OOC—
carbomethoxy CH_3OOC—
carbonyl OC=
carbonyldioxy —OCOO—
carboxy HOOC—
carbyl —C—
carvacryl

cetyl = hexadecyl
chaulmoogroyl $C_5H_7(CH_2)_{12}CO$— (*from chaulmoogric acid*)
chaulmoogryl $C_5H_7(CH_2)_{12}CH_2$— (*from chaulmoogryl alcohol*)
chloro Cl—
chloromercuri ClHg—
chrysenyl $C_{18}H_{11}$— (*from chrysene*)
cinnamal = cinnamylidene
cinnamenyl = styryl
cinnamoyl C_6H_5CH:$CHCO$—
cinnamyl C_6H_5CH:$CHCH_2$—
cinnamylidene C_6H_5CH:$CHCH$=

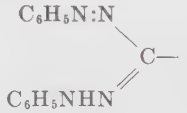
cresotyl 2,3-$HO(CH_3)C_6H_3CO$— (*from cresotic acid*) (2,3-*shown*)
cresoxy = toloxy
cresyl = *ar*-hydroxytolyl = tolyl
cresylene = tolylene
crotonyl $CH_3CH{:}CHCO$—
crotyl = 2-butenyl
cumal = *p*-cuminylidene
cumidino $(CH_3)_2CHC_6H_4NH$—
cuminal = *p*-cuminylidene
cuminyl *p*-$(CH_3)_2CHC_6H_4CH_2$—
cuminylidene
p-$(CH_3)_2CHC_6H_4CH{=}$
cumoyl (*from cumic acid*)
p-$(CH_3)_2CHC_6H_4CO$
cumyl $(CH_3)_2CHC_6H_4$—
cyanato NCO—
cyano NC—
cyclobutyl (*from cyclobutane*)
C_4H_7—
cyclohexadienyl (2,4- shown)



cyclohexadienylidene (2,4- *or* 2,5-; 2,5- *shown*)



cyclohexenyl C_6H_9— (*from cyclohexene. 3 isomers*)
cyclohexenylidene (2-shown)



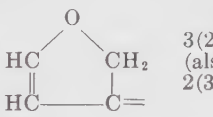
cyclohexyl C_6H_{11}— (*from cyclohexane*)
cyclohexylidene

cyclopentenyl C_5H_7— (*from cyclopentene*)
cyclopentyl C_5H_9— (*from cyclopentane*)
cyclopropyl C_3H_5— (*from cyclopropane*)
cymyl $C_{10}H_{13}$— (*from cymene*)
2-*p*-cymyl = carvacryl
3-*p*-cymyl = thymyl
decyl $CH_3(CH_2)_9$—
desyl $C_6H_5COCH(C_6H_5)$—
diazo —N:N— or N:N=
diazoamino —N:NNH—
disilanoxy H_3SiSiH_2O—
disilanyl H_3SiSiH_2—
disilanylamino H_3SiSiH_2NH—
disilanylene —SiH_2SiH_2—
disilazanoxy $H_3SiNHSiH_2O$—
disilazanyl $H_3SiNHSiH_2$—
disilazanylamino
$H_3SiNHSiH_2NH$—
disiloxanoxy $H_3SiOSiH_2O$—
disiloxanyl $H_3SiOSiH_2$—
disiloxanylamino
$H_3SiOSiH_2NH$—
dodecyl $CH_3(CH_2)_{10}CH_2$—
duryl 2,3,5,6-$(CH_3)_4C_6H$—
durylene

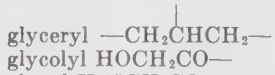
enanthyl $CH_3(CH_2)_5CO$—
epoxy —O— (*to different atoms already united in some other way*)
ethene = ethylene
ethenyl = ethylidyne = vinyl
ethinyl = ethynyl
ethoxalyl C_2H_5OOCCO—
ethoxy C_2H_5O—
ethyl CH_3CH_2—
ethylene —CH_2CH_2—
ethylenedioxy —$O(CH_2)_2O$—
ethylidene $CH_3CH{=}$
ethylidyne $CH_3C{\equiv}$
ethynyl $CH{:}C$—
ethynylene —$C{:}C$—
fenchyl $C_{10}H_{17}$— (*from fenchane*)
fluorenyl $C_{13}H_9$— (*from fluorene, 5 isomers*)
fluorenylidene $C_{13}H_8{=}$ (*from fluorene*)
fluoro F—
formamido HCONH—
formazyl

formyl OCH—
furfural = furfurylidene

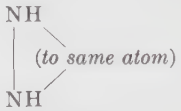
furfurylidene



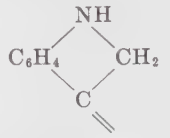
furyl (2 *isomers, 2- shown*)



furylidene



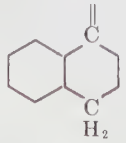
3(2)-
(also a
2(3)-form)



geranyl $C_{10}H_{17}$— (*from geraniol*)
glutamyl—
—$OCCHNH_2(CH_2)_2CO$—
glutaryl $OC(CH_2)_2CO$—
glyceroyl $CH_2OHCHOHCO$—

glycolyl $HOCH_2CO$—
glycyl H_2NCH_2CO—
glyoxylyl OCHCO—
guaiacyl = *o*-methoxyphenyl
guanidino $H_2NC(:NH)NH$—
guanyl $H_2NC(:NH)$—
hendecyl $CH_3(CH_2)_{10}$—
heptyl $CH_3(CH_2)_6$—
hexadecyl $CH_3(CH_2)_{14}CH_2$—
hexyl $CH_3(CH_2)_5$—
hippuryl $C_6H_5CONHCH_2CO$—
homopiperonyl
3,4-$(CH_2O_2)C_6H_3CH_2CH_2$—
hydnocarpoyl $C_5H_7(CH_2)_{10}CO$—
(*from hydnocarpic acid*)
hydnocarpyl $C_5H_7(CH_2)_{10}CH_2$—
(*from hydnocarpyl alcohol*)
hydrazi

hydrazino H_2NNH—
hydrazo —HNNH— (*to different atoms*)
hydrazono $H_2NN{=}$
hydrocinnamoyl
$C_6H_5CH_2CH_2CO$—
hydroxamino HONH—
hydroximino = isonitroso
hydroxy (hydroxyl) HO—
-idene *added to any radical usually means a double bond at point of attachment*
imidazolidyl $C_3H_7N_2$— (*from imidazolidine*)
imidazolyl $C_3H_3N_2$— (*from imidazole, 4 isomers*)
imido NH= (*properly, in acid groups only*); *by some used synonymously with imino*)
imino NH=
indanyl C_9H_9— (*from indan, 4 isomers*)
indenyl C_9H_7— (*from indene, 7 isomers*)
indolyl C_8H_6N— (*from indole, 7 isomers*)
indolylidene



3(2)-, etc.

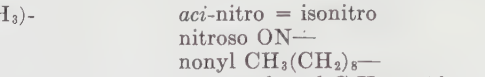
indyl = indolyl
iodo I—
iodoso OI—
iodoxy O_2I—
isoallyl = propenyl
isoamoxy
$(CH_3)_2CHCH_2CH_2O$—
isoamyl $(CH_3)_2CHCH_2CH_2$—
isoamylidene
$(CH_3)_2CHCH_2CH{=}$
isobutenyl = 2-methylpropenyl
isobutoxy $(CH_3)_2CHCH_2O$—
isobutyl $(CH_3)_2CHCH_2$—
isobutyryl $(CH_3)_2CHCO$—
isocyanato OCN—
isocyano C:N—
isohexyl $(CH_3)_2CH(CH_2)_3$—

isoindolyl C_8H_6N— (*from isoindole, 4 isomers*)
isoleucyl $CH_3CH_2CH(CH_3)$-$CHNH_2CO$—
isonitro HOON=
isonitroso HON=
1-isopentenyl = 3-methyl-1-butenyl
isophthalal = isophthalylidene
isophthaloyl —OCC_6H_4CO— (*m*)
isophthalylidene =HCC_6H_4CH= (*m*)
isopropenyl $CH_2{:}C(CH_3)$—
isopropoxy $(CH_3)_2CHO$—
isopropyl $(CH_3)_2CH$—
isopropylidene $(CH_3)_2C$=
isoquinolyl C_9H_6N— (*from isoquinoline, 7 isomers*)
isothiocyano S:C:N—
isovaleryl $(CH_3)_2CHCH_2CO$—
isoxazolyl C_3H_2NO— (*from isoxazole, 5 isomers*)
keto = oxo
lauroyl (*from lauric acid*) $CH_3(CH_2)_{10}CO$—
leucyl (*from leucine*) $(CH_3)_2CHCH_2CHNH_2CO$—
malonyl —$OCCH_2CO$—
menthyl

(*from menthane; 2-p- shown*)
mercapto HS—
mercuri —Hg—
mesityl 2,4,6-$(CH_3)_3C_6H_2$—
α-mesityl 3,5-$(CH_3)_2C_6H_3CH_2$—
mesyl = methylsulfonyl
methene = methylene
methenyl = methylidyne
methionyl $CH_2(SO_2)_{22}$=
methoxy CH_3O—
methyl CH_3—
methylene CH_2=
methylenedioxy —OCH_2O—
methylidyne CH≡
methylol = (hydroxymethyl)
morpholinyl (*from morpholine*) = C_4H_8NO—
myristoyl (*from myristic acid*) $CH_3(CH_2)_{12}CO$—
naphthal = naphthylmethylene
naphthalimido (*from naphthalimide*) $C_{10}H_6(CO)_2N$—
naphthenyl = naphthylmethylidyne
naphthoxy $C_{10}H_7O$—
naphthoyl $C_{10}H_7CO$—
naphthyl (1- or 2-) $C_{10}H_7$—
naphthylene $C_{10}H_6$=
naphthylidene

1(4)-, etc.

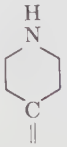
nitramino O_2NNH—
nitrilo N≡
nitro O_2N—
aci-nitro = isonitro
nitroso ON—
nonyl $CH_3(CH_2)_8$—
norcamphanyl C_7H_{11}— (*from norcamphane*)
octyl $CH_3(CH_2)_7$—
oleoyl (*from oleic acid*) $C_{17}H_{33}CO$—
oxalyl —OCCO—
oxamido $H_2NCOCONH$—
oxamyl H_2NCOCO—
oxazolyl C_3H_2NO— (*from oxazole*)
oximido = isonitroso
oxo O= (*to same atom*)
oxy —O— (*used as a connective; cf.* epoxy *and* oxo)
palmitoyl $CH_3(CH_2)_{14}CO$— (*from palmitic acid*)
pelargonyl $CH_3(CH_2)_7CO$— (*from pelargonic acid*)
pentamethylene —$CH_2(CH_2)_3CH_2$—



pentenyl (*like butenyl*) C_5H_9—
pentyl = amyl
perimidyl $C_{11}H_7N_2$— (*from perimidine, 8 isomers*)
perseleno Se:Se=
perthio (*replacing* 0 *only*) S=S=
phenacyl $C_6H_5COCH_2$—
phenacylidene C_6H_5COCH=
phenanthryl $C_{14}H_9$— (*from phenanthrene, 5 isomers*)
phenanthrylene —$C_{14}H_8$— (*several isomers*)
phenenyl C_6H_3≡ (*s-, as-, v-*)
phenethyl $C_6H_5CH_2CH_2$—
phenetidino $C_2H_5OC_6H_4NH$—
phenetyl (*o, m,* or *p*) $C_2H_5OC_6H_4$—
phenoxy C_6H_5O—
phenyl C_6H_5—
phenylacetyl $C_6H_5CH_2CO$—
phenylazo $C_6H_5N{:}N$—
phenylcarbamido = phenylureido
phenylene C_6H_4= (*o, m* or *p*)
phenylenebisazo —$N{:}NC_6H_4N{:}N$— (*o, m, p*)
phenylidene = cyclohexadienylidene
phenylsulfamyl $C_6H_5NHSO_2$—
phenylsulfonamido $C_6H_5SO_2NH$
phenylureido $C_6H_5NHCONH$—
phospharseno —P:As—
phosphazo —P:N—
phosphinico HOOP= (*from phosphinic acid*)
phosphino H_2P—
phospho O_2P—
phosphono $(HO)_2OP$—
phosphoro —P:P—
phosphoroso OP—

phthalal = phthalylidene

(*from phthalide*)

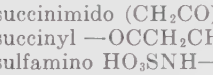


(*from phthalide*)
phthalimido $C_6H_4(CO)_2N$— (*o*)
phthaloyl —OCC_6H_4CO— (*o*)
phthalylidene =HCC_6H_4CH= (*o*)
phytyl

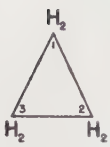
$(CH_3)_2CH(CH_2)_3CH(CH_3)(CH_2)_3$—
—$CH(CH_3)(CH_2)_3C(CH_3){:}CHCCH_2$—

picryl 2,4,6- $(NO_2)_3C_6H_2$—
piperidyl $C_5H_{10}N$— (*from piperidine, 4 isomers*)
piperonyl 3,4-$(CH_2O_2)C_6H_3CH_2$—
piperonylidene 3,4-$(CH_2O_2)C_6H_3CH$=
pivalyl $(CH_3)_3CCO$— (*from pivalic acid*)
prolyl (*from proline*)

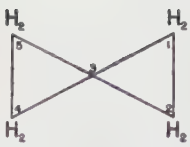
propargyl = 2-propynyl
propenyl $CH_3CH{:}CH$—
propenylidene $CH_3CH{:}C$=
propiolyl HC:CCO—
propionyl CH_3CH_2CO—
propoxy $CH_3CH_2CH_2O$—
propyl $CH_3CH_2CH_2$—
propylene —$CH(CH_3)CH_2$—
propylidene CH_3CH_2CH=
1-propynyl $CH_3C{:}C$—
2-propynyl $CH{:}CCH_2$—
pseudoallyl = isopropenyl
as-pseudocumyl 2,3,5-$(CH_3)_3C_6H_2$—
s-pseudocumyl 2,4,5-$(CH_3)C_6H_2$—
v-pseudocumyl 2,3,6-$(CH_3)_3C_6H_2$—
pseudoindolyl C_8H_6N— (*from pseudoindole, 7 isomers*)
pyranyl C_5H_5O— (2-α, 2-γ, 3-α-, etc.)
pyrazinyl $C_4H_3N_2$— (*from pyrazine*)
pyrazolidyl $C_3H_7N_2$— (*from pyrazolidine*)
pyrazolyl $C_3H_3N_2$— (*from pyrazole, 4 isomers*)
pyrenyl $C_{16}H_9$— (*from pyrene*)
pyridyl C_5H_4N— (*from pyridine, 3 isomers*)
pyridylidene

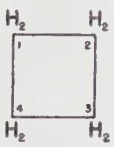


4(1), etc.

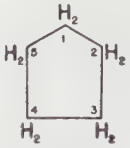


pyrimidyl $C_4H_3N_2$— (*from pyrimidine*)
pyromucyl = 2-furoyl
pyrrolidyl C_4H_8N— (*from pyrrolidine, 3 isomers*)
pyrroyl





CH:CH.CH:CH.N.CO—
pyrryl C_4H_4N— (*from pyrrole, 3 isomers*)
quinazolyl $C_8H_5N_2$— (*from quinazoline*)
quinolyl C_9H_6N— (*from quinoline, 7 isomers*)
quinonyl $C_6H_3O_2$— (*from quinone*)
quinoxalyl $C_8H_5N_2$— (*from quinoxaline*)
salicyl = *o*-hydroxyphenyl = *o*-hydroxybenzyl
salicylidene HOC_6H_4CH= (*o*)
salicyloyl HOC_6H_4CO— (*o*)
selenino (HO)OSe—
seleninyl OSe=
seleno Se=
selenocyano NCSe—
selenono HO_3Se—
selenonyl —SeO_2—
selenyl HSe—
semicarbazido $NH_2CONHNH$—
senecioyl $(CH_3)_2C:CHCO$— (*from senecioic acid*)
siloxy H_3SiO—
silyl H_3S—
silylamino H_3SiNH—
1-silyldisilanyl $(H_3Si)_2SiH$—
silylene H_2Si=
silylidene HSi≡
stannyl H_3Sn—
stearoyl $CH_3(CH_2)_{16}CO$—
stibarseno —Sb:As—
stibinico HOOSb=
stibino H_2Sb—
stibo O_2Sb—
stibono $(HO)_2OSb$—
stiboso O:Sb—
stibyl = stibino
stibylene HSb=
styrene —$CH(C_6H_5)CH_2$—
styrolene = styrene
styryl $C_6H_5CH:CH$—
succinamyl $H_2NCOCH_2CH_2CO$—
succinimido $(CH_2CO)_2N$—
succinyl —$OCCH_2CH_2CO$—
sulfamino HO_3SNH—
sulfamyl H_2NO_2S—
sulfanilamido *p*-$H_2NC_6H_4SO_2NH$— (*from sulfanilamide*)
sulfanilyl *p*-$H_2NC_6H_4SO_2$— (*from sulfanilic acid*)
sulfyhydryl = mercapto
sulfino HO_2S—
sulfinyl OS=
sulfo HO_3S—
sulfonamido —SO_2NH—
sulfonyl —SO_2—
sulfuryl = sulfonyl
tauryl $H_2NCH_2CH_2SO_2$—
telluro Te=
terephthalal = terephthalylidene
terephthaloyl —OCC_6H_4CO— (*p*)
terephthalylidene =HCC_6H_4CH= (*p*)
tetramethylene —$CH_2CH_2CH_2CH_2$—
tetrazolyl CHN_4— (*from tetrazole, 2 isomers*)
thenoyl C_4H_3SCO— (*from thiophenecarboxylic acid, 2 isomers*)
thenyl (2 *isomers*) $C_4H_3SCH_2$—
thenylidene (2 *isomers*) C_4H_3SCH=
thiazolidyl C_3H_6NS— (*from thiazolidine*)
thiazolyl C_3H_2NS— (*from thiazole, 3 isomers*)
thienyl C_4H_3S— (*from thiophene, 2 isomers*)
thio —S—
thiocarbamyl H_2NCS—
thiocarbonyl SC=
thiocyano NCS—
thiohydroxy = mercapto
thiol (S replacing O in OH) *Used in place of "thio" when required for distinction*
thiono (S replacing O in CO) *Used in place of "thio" when required for distinction*
thionyl = sulfinyl
thioxo (S replacing 2H in > CH_2)
thiuram = thiocarbamyl
thujyl $C_{10}H_{17}$— (*from sabinane, attached at 2-position*)
thymyl (*from thymol*)



HC:C(CH_3).CH:CH.C[$CH(CH_3)_2$].C—
toloxy (*o*, *m*, or *p*) $CH_3C_6H_4O$—
toluidino (*o*, *m* or *p*) $CH_3C_6H_4ONH$—
toluyl (*o*, *m* or *p*) $CH_3C_6H_4CO$—
α-toluyl = phenylacetyl
tolyl (*o*, *m* or *p*) $CH_3C_6H_4$—
α-tolyl = benzyl
tolylene (6 *isomers*) $CH_3C_6H_3$=
α-tolylene = benzylidene
tosyl = tolylsufonyl
triazeno $NH_2N:N$—
triazinyl $C_3H_2N_3$— (*from triazine*)
triazo = azido
triazolyl $C_2H_2N_3$— (*from triazole*)
trimethylene —$CH_2CH_2CH_2$—
trisilanyl $H_3SiSiH_2SiH_2$—
trisilanylene —$SiH_2SiH_2SiH_2$—
trityl = triphenylmethyl
tryptophyl $C_{11}H_{11}B_2O$— (*from tryptophan*)
tyrosyl *p*-$HOC_6H_4CH_2CHNH_2CO$— (*from tyrosine*)
undecyl = hendecyl (in sense $C_{11}H_{23}$—)
uramino = ureido
ureido H_2NCONH— (*by some used synonymously with ureylene*)
ureylene —HNCONH—
valeryl $CH_3(CH_2)_3CO$—
valyl $(CH_3)_2CHCHNH_2CO$— (*from valine*)
vanillal = vanillylidene
vanilloyl 3,4-$(CH_3O)(HO)C_6H_3CO$—
vanillyl 3,4-$(CH_3O)(HO)C_6H_3CH_2$—
vanillylidene 3,4-$(CH_3O)(HO)C_6H_3CH$=
veratral = veratrylidene
veratroyl 3,4-$(CH_3O)_2C_6H_3CO$—
veratryl 3,4-$(CH_3O)_2C_6H_3CH_2$—
veratrylidene 3,4-$(CH_3O)_2C_6H_3CH$=
vinyl $H_2C:CH$—
vinylene —CH:CH—
vinylidene $H_2C:C$=
xanthyl $C_{13}H_9O$— (*from xanthene, 6 isomers*)
xenyl = biphenylyl
xyloyl $(CH_3)_2C_6H_3CO$— (*from xylic acid, 7 isomers*)
xylyl $(CH_3)_2C_6H_3$—
xylylene —$H_2CC_6H_4CH_2$—

EXPLANATION OF TABLE

1. The table of Physical Constants of Organic Compounds is a compilation of data on some 13600 organic compounds that include those of wide application in teaching, industry, medicine and research.

CONTENTS OF TABLE

2. **Number of entry.** Each entry has a number preceded by a letter corresponding to the first letter of the name of the parent compound (see paragraphs 17–26, 31, 32). Cross references are left unnumbered. The number of entry is used in the formula, melting point and boiling point indexes (see paragraphs 13–15).

3. **Name of compound.** See rules for naming of compounds (paragraphs 16 ff.).

4. **Synonyms and formula.**

a) *Synonyms.* For the sake of brevity, the number of synonyms in an entry is limited. Additional synonyms may readily be formed by derivation from the names given to simpler or less substituted compounds; *e.g.:* **Benzoic acid, 4-nitro-,** ethyl ester is given no synonyms but they may be derived from those appearing under **Benzoic acid,** for example, ethyl *p*-nitrobenzenecarboxylate.

b) *Formula.* Each entry has either a structural or an empirical formula. In the second case there are the following possibilities:

i) The structural formula was not known at the time of compilation.

iii) The compound is cyclic and appears among a series of compounds derived from the same cyclic parent compound; *e.g.:*

u133 **Uric acid, 7-methyl-** $C_6H_6N_4O_3$. *See* u131 means that in entry u131 appears the numbered skeleton of **Uric acid,** and the structural formula of u133 may be derived from that of u131.

Structural formulae in the Table give generally no configurational details, and when they do, they seldom give absolute configurations. These details are to be looked for either in the original literature or in specialized textbooks.

5. **Molecular weight.** Computed according to International Atomic Weight values of 1961.

6. **Crystalline form, color and specific rotation.**

a) *Crystalline form.* Solid compounds are to be considered as crystalline if not otherwise stated. Data on solvents used and solvents of crystallization are given in brackets. Some examples will explain the usage of the Table (see also list of abbreviations):

ABBREVIATION	MEANING
pl	plates
pl(al)	plates obtained from alcohol as the solvent
pl(al + 1½)	plates obtained from alcohol crystallizing with 1½ molecules of the **same solvent** per molecule of compound
pl(al + ?)	as above but the amount of solvent of crystallization per molecule of compound is undefined
pl(aq ace + 2w)	here the solvent of crystallization is one of the components of the solvent, *i.e.*, two molecules of water
(al)	compound crystallizes from alcohol but crystalline form is not reported

If no melting point is given in the Table the compound is a liquid at room temperature, unless otherwise stated.

b) *Color:* No special remark is made if the compound is colorless or no data on its color are available; otherwise an abbreviation appears before the crystalline form. (See table of abbreviations.)

c) *Specific rotation* appears according to the common usage, *e.g.:*

$$[a]_D^{25} - 25.8(\text{w, c} = 4)$$

Bracketted abbreviations indicate solvent and concentration, *i.e.*, in the above example, solvent water and concentration 4%.

EXPLANATION OF TABLE (Continued)

7. **Melting point.** Remarks on this physical property appear as abbreviations after the m.p. Melting points of questionable accuracy are given in brackets.

8. **Boiling point.** The pressure at which this physical property was determined appears as a superscript. If no superscript is given, pressure is about one atmosphere. Remarks on this physical property appear as abbreviations. Boiling points of questionable accuracy are given in brackets.

9. **Density** is relative to water, otherwise it has the dimensions g/ml. A superscript indicates the temperature of the liquid and a subscript indicates the temperature of water to which the density is referred.

10. **Refractive index** is reported for the D line of the spectrum of sodium (n_D). The temperature of determination of this physical property appears as a superscript.

11. **Solubility.** Data are given for the most common solvents. As numerical data on this property scarcely appear in the literature, and when they appear their degree of approximation is not great, it was preferred to rely on the intuitive meaning that the following scale has for the chemist (corresponding abbreviations in brackets): insoluble (i), slightly soluble (δ), soluble (s), very soluble (v), miscible (∞), decomposes (d). If no special remark is made about the temperature, the reference is to room temperature; otherwise, a superscript appears.

12. **Literature references** are given to general sources of data such as *Beilstein's Handbook*, *Elsevier's Encyclopaedia*, etc. The superscript after the boldtype number indicates the number of the supplement (Ergenzungswerk) of *Beilstein's Handbook;* e.g.: **B7**[1], 12 means page 12 of the first supplement to volume 7 of *Beilstein.*

INDEXES

Three indexes are found at the end of the Table:

13. **Empirical formula index** is arranged according to increasing C, H, and remaining elements in alphabetical order. Hydrates are entered under the formula of the *anhydrous* compound. Salts, complexes, etc., are found under their total formulae.

14. **Melting point index** is arranged according to increasing melting or freezing points. Only the lower temperature of the melting range is given. Remarks to the melting point in the main table, such as decomposition, sublimation, etc,, are omitted. Melting points are rounded off to the nearest unit.

15. **Boiling point index** is arranged according to increasing boiling point of compounds of which the boiling point is given at a pressure near to 1 atm. (*i.e.*, 700–780 mm. Hg). Only the lower temperature of the boiling range is given. No special entries are made for remarks on the boiling point contained in the main table. Boiling points are rounded off to the nearest unit.

RULES FOR THE NAMING OF COMPOUNDS*

16. Naming of compounds is based mainly on *International Union of Chemistry* (*IUC*) and *Chemical Abstracts* usages, with variations adapted to the scope and range of the Table, in order to enable the user to find compounds even when their trivial names are not known.

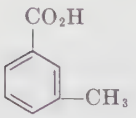
17. A suitable systematic nomenclature is used in order to bring as near as possible compounds that are isomeric derivatives of the same parent compound, *e.g.*, physical properties appear under the entries **Benzene, 1,2-dihydroxy-, Benzene, 1,3-dihydroxy-,** and **Benzene, 1,4-dihydroxy-;** under **Hydroquinone, Pyrocatechol** and **Resorcinol** a cross reference directs the user towards the systematic names. No special entry or cross-reference is made for *e.g.*, **Bromoresorcinol;** this will be found under **Benzene, bromo(dihydroxy)-,** with the appropriate numbering before the names of the substituents. Another example: **4-Chloroquinaldine;** the trivial name of the parent compound is **Quinaldine,** it appears as: **Quinaldine** *see* **Quinoline, 2-methyl-;** accordingly the properties of **4-Chloroquinaldine** will appear under **Quinoline, 4-chloro-2-methyl-.**

18. Physical constants of a compound having widely used trivial and systematic names will appear under one of them only. The remaining names will appear with a cross-reference to the assigned name, *e.g.:*

Resorcinol *see* **Benzene, 1,3-dihydroxy-**

Propanoic acid, 2-amino- *see* **Alanine**

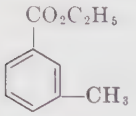
Very complicated compounds such as some natural products, dyes, etc. appear almost exclusively under their trivial names.



* The rules for nomenclature followed by the Table were adapted to the present, relatively limited scope of some thousands of compounds. For other use the IUPAC 1957 rules, which appear in this Handbook, may be consulted.

19. Rules adopted by the Table for the naming of compounds according to their functional groups appear in paragraphs 27 ff.

20. The naming of a compound has three phases:



a) Determination of the parent compound.
b) Determination and numbering of the substituents in the skeleton of the parent compound.
c) Determination of the derivatives of the principal functions of the compound.

e.g.:

Phase a) **Benzoic acid**
Phase b) **3-methyl-**

Accordingly it appears as **Benzoic acid, 3-methyl-**

Phase a) **Benzoic acid**
Phase b) **3-methyl-**
Phase c) ethyl ester

therefore it appears as **Benzoic acid, 3-methyl-,** ethyl ester.

21. The parent compound has at most one kind of principal function, (*e.g.:* acid) but this function may be multiple, (*e.g.:* diacid, triacid, etc.); examples:

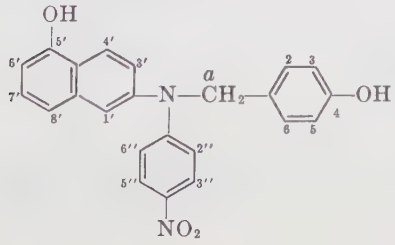
$CH_3COCH_2CH_2CO_2H$ appears as **Pentanoic acid, 4-oxo-**
not as: **Pentanon-4-on-1-oic acid**

$HO_2CCH_2CH(CH_3)COCH_2CO_2H$ appears as **Hexanedioic acid, 3-methyl-4-oxo-**

Unsaturation is not considered as a function and, when possible, it is included in the name of the parent compound; *e.g.:*

$CH_2{:}CHCH_2CO_2H$ appears as **3-Butenoic acid.**

Exceptions to this rule are some cyclic ketones that may be designated as ring systems (see paragraph 83) and some natural products, such as **Pregnenolone** (the functions alcohol and ketone appear in the parent compound).



22. Entries in the Table are made first according to alphabetical order of parent compounds (paragraph 20, phase a), and then according to alphabetical order of the substituents in the skeleton of the parent compound (paragraph 20, phase b). It should be emphasized that numbers or single letters that are used in the designation of the compound are not considered for the alphabetisation. If the designation of a compound includes phase c of paragraph 20 this compound appears immediately after the compound that is designated without phase c and has the same substituents bearing the same numbers; *e.g.:*

Benzoic acid
Benzoic acid, 2-chloro-
Benzoic acid, 2-chloro-, ethyl ester
Benzoic acid, 3-chloro-
Benzoic acid, 3-chloro-, allyl ester

23. Prefixes indicating multiplicity of substituents as **di-, tri-, bis-, tris,** etc. and the prefix **iso-,** as in **dimethyl-, tripropyl-, bis(nitrophenyl)-, tris(aminomethyl)-, isopropyl-,** etc., are indexed under **d, t, b, t, i** respectively. The prefixes *sec-* and *tert-* are regarded as numbers, and therefore, they are not considered for the alphabetization.

24. If the designation of a compound is difficult, the use of the empirical formula index is suggested (paragraph 13).

25. When a compound is designated by the name of its principal functional group that alone is not a compound, as is the case with some amines, ketones, azo-compounds, etc., after the name of the functions the skeleton is designated by alphabetical order, and then the substituents on each of the groups attached to the principal function; *e.g.:*

Amine, benzyl 2-naphthyl phenyl, 4,5′-dihydroxy-4″-nitro-

It is to be noted that substituents of benzyl (the first radical in the name) are unprimed; substituents of naphthyl (the second radical in the name) are primed; substituents of phenyl (the third radical in the name) are doubly primed.

26. The principal function of the parent compound has a number as low as possible.

HYDROCARBONS*

27. **Aliphatic hydrocarbons.** IUC rules 4–10 are followed, but some remarks are added:

a) For C_{11} hendecane (and not undecane) is used (see IUC rule 5).

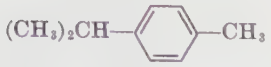
b) From the possibilities in IUC rule 7 the alphabetical order is used always (see paragraph 22).

c) Regarding IUC rules 8 and 9: numbers before the name of the hydrocarbon or the particle indicating unsaturation indicate the carbon with the lower number of the two connected by the unsaturated link, *e.g.:*

$CH_3CH_2CH_2CH{:}CH_2$	**1-Pentene**
$CH_2{:}C{:}CHCH_3$	**1,2-Butadiene**
$CH_3C{\vdots}CCH{:}CHCH{:}CHCH_3$	**2,4-Octadien-6-yne**

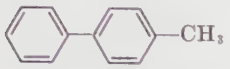
d) Regarding IUC rule 10: in an unsaturated hydrocarbon the longest chain containing the maximum number of double and triple bonds will be considered; *e.g.:*

$CH_2{:}C(CH_2CH_3)CH{:}CH_2$	appears as **1-3-Butadiene, 2-ethyl-**
	not as **1-Pentene, 3-methylene-**
	not as **1-Butene, 2-ethenyl-**



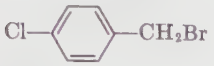
Preference is given to the double bond over the triple bond in the fundamental chain; *e.g.:*

$CH_2{:}CHCHCH{:}CH_2$ $\quad\quad\quad

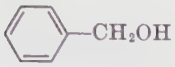


For alkyl derivatives of benzene the only trivial name retained is **toluene** for $C_6H_5CH_3$. Toluene derivatives appear under the heading **Toluene** if no other carbon atom is attached either to the methyl group or to the ring; otherwise the name will appear under **Benzene** or elsewhere as suitable; *e.g.:*

Toluene, 4-amino-



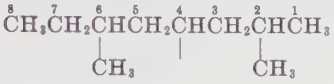
Benzene, 1-isopropyl-4-methyl-



Biphenyl, 4-methyl-

Substitution in the methyl group of toluene will be labelled *a* and the word benzyl will not appear as a parent compound (only as a substituent); *e.g.:*

Toluene, *a*-bromo-4-chloro-



Toluene, *a*-hydroxy-
(cross-reference under **Benzyl alcohol**).

Regarding IUC rule 49aII the trivial name **Stilbene** is used instead of **Ethene, 1,2-diphenyl-.**

29. **Heterocyclic systems.** Trivial names are used, or when these are lacking systematic names are formed by using the homocyclic system name and the particles **oxa-, aza-, thia-,** etc.

The following trivial names are used for simple heterocyclic compounds: **furan, pyran, pyrrole, pyrazole, imidazole, piperidine, pyridine, pyrazine, pyrimidine, pyrazidine, thiophene,** etc. Fused heterocyclic systems follow the same rule; trivial names such as acridine, indole, quinoline, isoquinoline, quinazoline, quinoxaline, xanthene, etc., or juxtaposed names such as **1,2-benzopyran,** etc. are used. All names of fused ring systems beginning with **benzo-, dibenzo-,** etc. appear under **b, d,** etc. respectively.

30. **Radicals.** Normal alkyl radicals are named according to the Geneva designation. The following radical names are also used: **phenyl, benzyl, tolyl, styryl, allyl, isopropyl, isobutyl,** *sec*-**butyl,** *tert*-**butyl, ethenyl, ethynyl.** Larger non-normal alkyl radicals are designated by forming the longest chain containing the radical linkage and numbering the carbon on which the radical links itself to other groups according to the nearest end of the longest chain; *e.g.:*

(2,6-dimethyl-4-octyl)-

The following IUC rules are also used: 54–62, 64, 65, 67.

31. **Substituted Hydrocarbons.** The following substituents never appear in a parent compound: **arsono-**(—AsO), **arso-**(—AsO_2), **boryl-** (—BO), **bromo-** (—Br), **chloro-** (—Cl), **fluoro-** (—F), **iodo-** (—I), **iodoso-** (—IO), **iodoxy-** (—IO_2), **nitro-** (—NO_2), **nitroso-** (—NO), **phospho-** (—PO_2), **phosphoroso-** (—PO), **stibo-** (—SbO_2), **triazo-** (—N_3). These are always treated as substituents (paragraph 20, phase b).

COMPOUNDS CONTAINING FUNCTIONAL GROUPS

32. **Order of precedence of functions.** When a compound bears one or more functions the parent compound is designated according to the following order of precedence: onium compound, acid (and derivatives of the acidic function), aldehyde, ketone, alcohol, amine, ether, sulfide, sulfone, sulfoxide, etc.

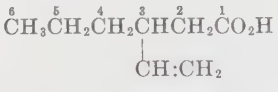
ONIUM COMPOUNDS

33. Onium compounds appear mainly under their trivial names.

34. **Ammonium compounds.** When four organic radicals are attached to the N atom, the compound appears under **Ammonium,** otherwise it appears as the corresponding salt of an amine; *e.g.:*

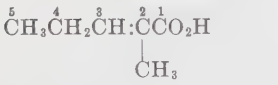
Ammonium, phenyl trimethyl, iodide

Amine, trimethyl, hydrochloride



Glycine, hydrochloride

35. **Betaines.** The word betaine appears after the name of the corresponding acid ("betaine" alone is the name of a compound); *e.g.:*

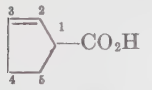


Glycine, *N*,*N*-dimethyl-*N*-phenyl-, betaine

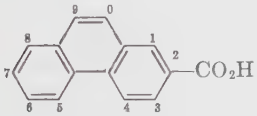
ACIDS AND ACID DERIVATIVES

36. **Aliphatic monocarboxylic acids.** The longest chain containing the carboxylic group is taken as the parent compound. The carbon of the carboxyl group is numbered 1. The Geneva nomenclature is followed. (IUC rule 29); *e.g.:*

Hexanoic acid, 3-ethenyl-

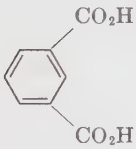


2-Pentenoic acid, 2-methyl-

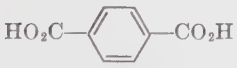


In exception to this rule, the following trivial names are retained:

HCO_2H	**Formic acid**
CH_3CO_2H	**Acetic acid**
$C_6H_5CH{:}CHCO_2H$	**Cinnamic acid**

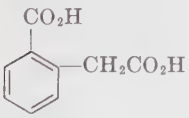


37. **Cyclic acids.** After the name of the ring the suffix **-carboxylic acid** is attached. The atom to which the carboxyl is attached is numbered 1 unless the ring system has a fixed numbering, in which case the carboxylic group takes a number as low as possible; *e.g.:*



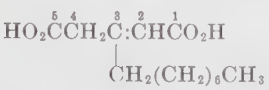
2-Cyclopentenecarboxylic acid

2-Phenanthrenecarboxylic acid



1,3-Benzenedicarboxylic acid
(cross reference under **Isophthalic acid**)

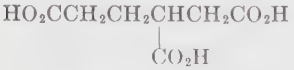
1,4-Benzenedicarboxylic acid
(cross reference under **Terephthalic acid**)



Linear acids are given preference over cyclic acids; *e.g.:*

Acetic acid, (2-carboxyphenyl)-
(cross reference under **Homophthalic acid**)

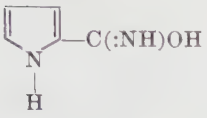
Exceptions: **benzoic acid, 1-naphthoic acid, 2-naphthoic acid, phthalic acid.**

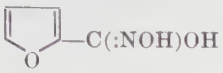


38. **Aliphatic, dicarboxylic acids** are found under the Geneva name of the chain containing both carboxylic groups; *e.g.:*

2-Pentenedioic acid, 3-octyl-

Trivial names are used for the following acids: **oxalic, malonic, succinic, maleic, fumaric, tartaric, citric.**





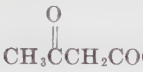
39. **Aliphatic polycarboxylic acids** are designated using the **-carboxylic acid** suffix; *e.g.:*

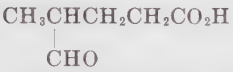
1,2,4-Butanetricarboxylic acid

40. **Thioacids.** After the name of the acid one of the following particles will appear: **thio-, dithio-, thiolo-; thiono-.** The last two appear only when it is certain that the ketonic or the hydroxylic oxygen is substituted by a sulfur atom.

41. **Imidic, hydroxamic, nitrolic and nitrosolic acids.** Only simple compounds of this type appear in the Table. The various cases arising are exemplified as follows:

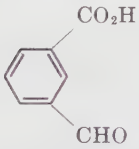
$CH_3CH_2CH_2C(:NH)OH$	**Butanimidic acid**
$C_6H_5C(:NH)OH$	**Benzimidic acid**
	**2-Pyrrolecarboxymidic acid**
$CH_3CH_2C(:NOH)OH$	**Propanehydroxamic acid**
$C_6H_5C(:NOH)OH$	**Benzohydroxamic acid**
	**2-Furancarbohydroxamic acid**
$CH_3C(:NOH)NO_2$	**Acetonitrolic acid**
$CH_3C(:NOH)NO$	**Acetonitrosolic acid**

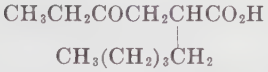




42. **Sulfonic and sulfinic acids.** According to IUC rule 47, with the following comment: onium and carboxylic acids are functions that precede the sulfonic and sulfinic acids, and so when the former functions are present in the compound the particles **sulfo-** and **sulfino-** will be used; *e.g.:*

	**Benzoic acid, 4-sulfo-**





43. **Sulfenic acids** are found under the corresponding hydrocarbon structure followed by the suffix **sulfenic acid;** *e.g.:*

$C_6H_5—S—OC_2H_5$	**Benzenesulfenic acid,** ethyl ester.

44. **Aldehydic and ketonic acids.** When the carbonyl group is present in the principal chain the particle **oxo-** is used; *e.g.:*

	**Butanoic acid, 3-oxo-** (cross reference under **Acetoacetic acid**)
	**Pentanoic acid, 4-methyl-5-oxo-**

If the aldehyde group is not in the principal chain the particles **formyl-** or **oxo-** are used; *e.g.:*

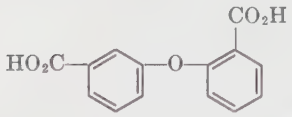
	**Benzoic acid, 3-formyl-**
	**Dodecanoic acid, 2(2-oxobutyl)-**

See however paragraphs 83, 84.

45. **Hydroxyacids.** The hydroxy group is considered as a substituent; *e.g.:*

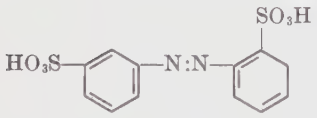
$CH_3CHOHCO_2H$	**Propanoic acid, 2-hydroxy-** (cross reference under **Lactic acid**).

Exceptions: **tartaric, citric,** and acids derived from carbohydrates such as gluconic, mannonic, etc.



46. **Aminoacids.** Most of them appear under their trivial names with cross references under their systematic names.

47. **Orthoacids** appear under the heading **Ortho-;** *e.g.:*



$CH_3C(OCH_3)_3$	**Orthoacetic acid,** trimethyl ester.
$C_6H_5C(OC_2H_5)_3$	**Orthobenzoic acid,** triethyl ester.

48. **Acids attached by a non-carbon link.** The following examples explain the usage of the Table where the same acid appears attached twice to a non-carbon atom:

$NH(CH_2CO_2H)_2$ — **Acetic acid, iminodi-**

Benzoic acid, 2,3′-oxydi-

Benzenesulfonic acid, 2,3′-azodi-

If the acids are different the name of the compound may appear under one of them or under the name of the linking functions.

49. After the name of the parent acid the particle **per-** is used; *e.g.:*

CH_3CO_3H — **Acetic acid, per-**

50. **Organic acids other than carboxylic, sulfonic, sulfinic and sulfenic.** See IUC rule 34.

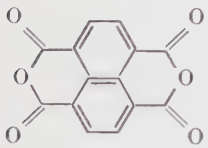
51. **Inorganic acids.** Their derivatives may appear either under the name of the acid or under the name of the organic base; *e.g.:*

$SO_2(OCH_3)_2$ — **Sulfuric acid,** dimethyl ester
$C_6H_5NH_2.HNO_3$ — **Aniline** nitrate.

52. **Isocyanides.** The prefix **isocyano-** is used for the substituent —NC; *e.g.:*

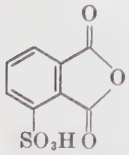
C_6H_5—NC — **Benzene, isocyano-**

53. **Anhydrides.**



a) *Symmetrical anhydrides of monobasic acids.* After the name of the acid comes the word anhydride; *e.g.:*

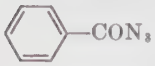
$(CH_3CHBrCO)_2O$ — **Propanoic acid, 2-bromo-,** anhydride.



b) *Mixed anhydrides:* Both possible names appear (one of them as a cross-reference); *e.g.:*

$CH_3CHClCOOCOCH_2CH_2Cl$ — **Propanoic acid, 2-chloro-,** anhydride with 3-chloropropanoic acid; and also:
Propanoic acid, 3-chloro-, anhydride with 2-chloropropanoic acid.

c) *Cyclic anhydrides of polyacids* are named by placing the word anhydride after the name of the acid; *e.g.:*

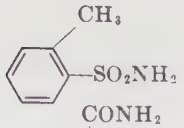


1,4,5,8-Naphthalenetetracarboxylic acid, 1:8,4:5-dianhydride

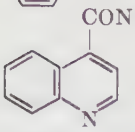
Phthalic acid, 3-sulfo-, anhydride.

54. **Acid halides and azides.** The name of the substituent of the hydroxyl group appears after the name of the corresponding acid; *e.g.:*

$CH_3CHClCOCl$ — **Propanoic acid, 2-chloro-,** chloride



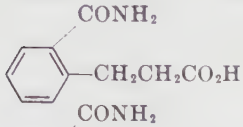
Benzoic acid, azide



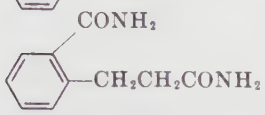
55. **Amides.**

a) *Primary amides* appear under the name of the corresponding acid followed by the word amide; *e.g.:*

CH_3CONH_2 — **Acetic acid,** amide
(cross reference under **Acetamide**)

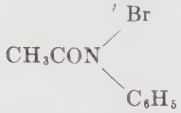


2-Toluenesulfonic acid, amide



4-Quinolinecarboxylic acid, amide

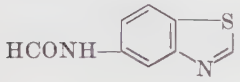
Nevertheless, when in forming the name of the corresponding acid the particle **carboxy-** is used, and this group turns to an amide group, the prefix **carbamyl-** is used; *e.g.:*



Propanoic acid, 3(2-carbamylphenyl)- (see paragraph 37),

Propanoic acid, 3(2-carbamylphenyl)-, amide

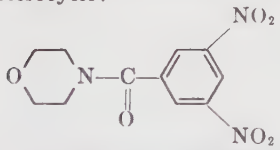
b) *N-Alkyl, N-Aryl and other N-derivatives of amides.* Substituents in the N atom appear in alphabetical order after the word amide; *e.g.:*



Acetic acid, amide, *N*-bromo-*N*-phenyl-

Compounds with heterocyclic radicals attached to the *N*-atom of formamide, acetamide and benzamide are named with the heterocycle as parent compound using the particles **formamido-, acetamido-** and **benzamido;** *e.g.:*

Pyridine, 2-acetamido-



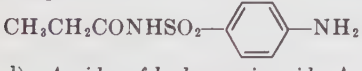
Benzothiazole, 5-formamido-

Derivatives of other amides follow the general rule stated above, *e.g.:*

Propanoic acid, amide, *N*(2-pyridyl)-

Amides in which the amide nitrogen is part of a heterocyclic system are named as acyl derivatives of that heterocycle:

Morpholine, 4(3,5-dinitrobenzoyl)-



c) *Secondary and tertiary amides* are named according to the largest carboxylic acid from which it can be derived; *e.g.:*

$CH_3CONHCOCH_3$ — **Acetic acid,** amide, *N*-acetyl- (cross reference under **Diacetamide**)

$C_6H_5CONHCOCH_3$ — **Benzoic acid,** amide, *N*-acetyl-

$(C_6H_5CO)_3N$ — **Benzoic acid,** amide, *N,N*-dibenzoyl- (cross reference under **Tribenzamide**)

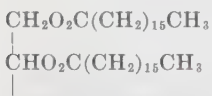
A mixed amide of a carboxylic and a sulfonic acid is named as a derivative of the amide of the carboxylic acid *e.g.:*

Propanoic acid, amide, *N*(4-aminobenzenesulfonyl)-

d) *Amides of hydroxamic acids.* As in paragraph 52a.

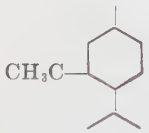
56. **Polypeptides.** A small number of polypeptides appear in the Table. They are found under their trivial name, or under the name of the amino acid that retains its carboxylic group and shares its amino group; *e.g.:*

$CH_3CH(NH_2)CONHCH_2CONHCH_2CO_2H$



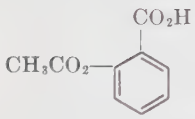
Glycine, *N*(*N*-alanylglycyl)-

57. **Hydrazides of acids.** See paragraph 110.



58. **Esters.** After the name of the corresponding acid comes the radical and the word ester; *e.g.:*

$C_6H_5COOC_6H_5$	**Benzoic acid,** phenyl ester
$HOSO_2OCH_3$	**Sulfuric acid,** monomethyl ester



Nevertheless, esters of complicated and polyvalent alcohols may appear under the name of the alcohol; *e.g.:*

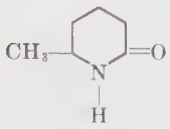
Glycerol, triheptadecenoate

Menthol, acetate

Aspirin, *see* **Benzoic acid, 2-hydroxy-,** acetate

59. **Orthoesters.** See paragraph 47.

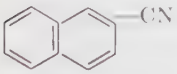
60. **Amidoximes** are treated as amides of hydroxamic acid (see paragraphs 41, 55).



61. **Amidines.** After the name of the corresponding acid the word **amidine** appears; *e.g.:*

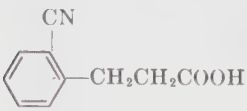
$CH_3(CH_2)_6C(:NH)NH_2$	**Octanoic acid,** amidine

The nitrogen atom of the $—NH_2$ group is designated *N* and that of the $=NH$ group *N'*. If a nitrogen atom of the amidine function is a part of a ring the compound is named according to the heterocyclic system.



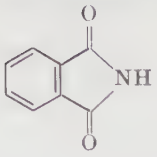
62. **Betaines.** See paragraph 35.

63. **Lactams and lactones.** If there is no name for the ring system of the compound, the word lactam or lactone appears after the name of the corresponding aminoacid or hydroxyacid; *e.g.:*



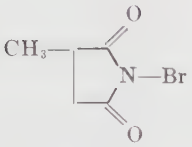
Hexanoic acid, 5-amino-, lactam,
see **2-Piperidone, 6-methyl-**

64. **Nitriles.** After the name of the corresponding acid the word nitrile appears; *e.g.:*



$CH_3CH(NH_2)CN$	**Alanine,** nitrile
	**2-Naphthoic acid,** nitrile
$CH_3(CH_2)_5CN$	**Heptanoic acid,** nitrile
$NCCH_2CO_2H$	**Malonic acid,** mononitrile (cross-reference under **Cyanoacetic acid**)

If the group —CN comes instead of a $—CO_2H$ group that is designated as **carboxy-,** the particle **cyano-** is used; *e.g.:*



Propanoic acid, 3(2-cyanophenyl)-

65. **Imides.** The word imide appears after the name of the corresponding dicarboxylic acid:

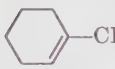
Phthalic acid, imide
(cross-reference under **Phthalimide**)

Succinic acid, 2-methyl-, imide, *N*-bromo-

For imides of monobasic acids see paragraph 55c.

66. **Cyanates, isocyanates, thiocyanates and isothiocyanates,** appear under the headings **Cyanic acid, Ioscyanic acid, Thiocyanic acid** and **Isothiocyanic acid** respectively, or, when the radical attached to these groups is complicated, the compound appears under the name of the corresponding alcohol (these rules are identical to those given for esters, amides, etc. in paragraphs 58, ff.).

ALDEHYDES



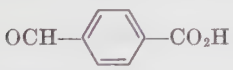
67. Geneva names for saturated and unsaturated aliphatic mono- and di-aldehydes are formed by dropping the final **e** of the name of the hydrocarbon and adding -al or (without dropping the **e**) **-dial.** The largest chain having the aldehydic group (or groups) as terminals is chosen.

Examples:

$CH_3(CH_2)_9CHO$	**Hendecanal**
$\overset{5}{C}H_3\overset{4}{C}H_2\overset{3}{C}H{:}\overset{2}{C}H\overset{1}{C}HO$	**2-Pentenal**
$OCHCH_2CH{:}CHCH{:}CHCH_2CHO$	**3,5-Octadienedial**

Some trivial names are used whenever the trivial name of the corresponding acid is used, *e.g.:* **formaldehyde, acetaldehyde, benzaldehyde, 1- and 2-naphthaldehyde, cinnamaldehyde,** etc.

When the **-carboxylic acid** nomenclature is used for the corresponding acid (see paragraphs 37, 39), the name of the aldehyde is formed by the use of the suffix **-carboxaldehyde;** *e.g.:*



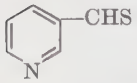
1-Cyclohexanecarboxaldehyde

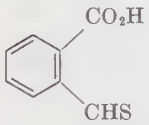
1,4-Benzenedicarboxaldehyde

$OCH(CH_2)_4CH(CHO)_2$ **1,1,5-Pentanetricarboxaldehyde**

When a function of higher rank (see paragraph 32) appears in the molecule the —CHO group is designated as **oxo-** or as **formyl-** as the case demands; *e.g.:*

Benzoic acid, 4-formyl-





$OCHCH_2CH_2CO_2H$ **Butanoic acid, 4-oxo-**

$CH_3CH_2CH_2\underset{\displaystyle CHO}{\underset{|}{C}}HCH_2CO_2H$ **Hexanoic acid, 3-formyl-**

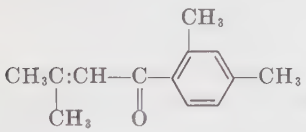
68. **Acetals, hemiacetals and hydrates of aldehydes or ketones** appear in the Table immediately after the corresponding aldehyde or ketone. The following examples illustrate the nomenclature:

$CH_3CH_2CH(OC_2H_5)$	**Propanal,** diethyl acetal
$CH_3CH_2CH(OCH_3)OH$	**Propanal,** methyl hemiacetal
$Cl_3CCH(OH)_2$	**Acetaldehyde, trichloro-,** hydrate

69. **Thioaldehydes** are named by using the particles **-thial, -carbothialdehyde, thioformyl-** or **thioxo-** corresponding to the oxygen analogs (see paragraph 67). If the corresponding aldehydes appear under trivial names, the particle **thio-** is used; *e.g.:*

CH_3CHS	**Acetaldehyde, thio-**
CH_3CH_2CHS	**Propanethial**
	**3-Pyridinecarbothialdehyde**
	**Benzoic acid, 2-thioformyl-**
$SCHCH_2CO_2H$	**Propanoic acid, 3-thioxo-**

70. **Azines.** See paragraph 109.

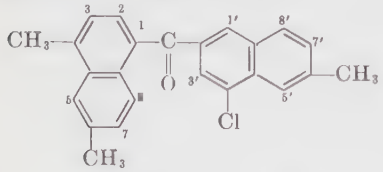


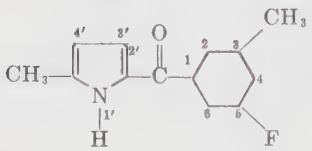
71. **Imines.** See paragraph 99.

72. **Oximes.** The word oxime appears after the name of the corresponding aldehyde (or ketone).

KETONES

73. Ketones with no ring attached directly to the carbonyl group are named according to IUC rule 27.



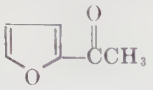


74. Ketones with one aromatic ring attached to the carbonyl group are named according to IUC rule 27; *e.g.:*

	**2-Buten-1-one, 1(2,4-dimethylphenyl)-3-methyl-**
$CH_3CH_2COC_6H_5$	**1-Propanone, 1-phenyl-** (cross-reference under **Propiophenone**)

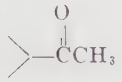
The following are exceptions:

$C_6H_5COCH_3$	**Acetophenone**
$C_6H_5CH{:}CHCOC_6H_5$	**Chalcone**
$C_6H_5COC_6H_5$	**Benzophenone.**



75. Monoketones with two rings attached to both sides of the carbonyl group appear under the heading **Ketone,** followed by the two rings in alphabetical order and then followed by the substituents in the rings (see paragraph 25); *e.g.:*

	**Ketone, 1,2′-dinaphthyl, 4′-chloro-4,6,6′-trimethyl-**
	**Ketone, cyclohexyl 2-pyrryl, 3,5′-dimethyl-5-fluoro-**

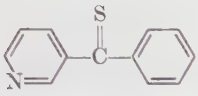


Exception:

$C_6H_5COC_6H_5$	**Benzophenone**

76. Acetyl derivatives of cyclic compounds other than acetophenone are named according to the name of the cyclic compound:

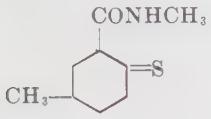
Furan, 2-acetyl-



Cyclopropane, acetyl-

77. **Acetals, hemiacetals and hydrates of ketones.** See paragraph 68.

78. **Thiones (thioketones)** follow the Geneva system and IUC rule 27. When the corresponding ketone was given a trivial name the thione has the same name followed by the particle **thio-**; *e.g.:*



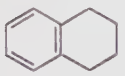
$C_6H_5CSCH_3$ **Acetophenone, thio-**

The particle **thioacetyl-** is used to designate the group CH_3CS— and its use is similar to that of the particle **acetyl-** (see paragraph 76). The heading corresponding to **Ketone** is **Thione**; and it is used as described in paragraph 75; *e.g.:*

Thione, cyclohexyl 3-pyridyl

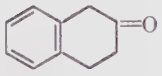
The particle corresponding to **oxo-** is **thioxo-**; *e.g.:*

Cyclohexanecarboxylic acid, 5-methyl-2-thioxo-, amide, *N*-**methyl-**



79. **Ketenes.** According to IUC rule 28.

80. **Azines.** See paragraph 109.



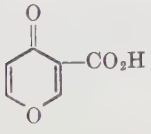
81. **Imines.** See paragraph 99.

82. **Oximes.** See paragraph 72.

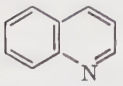
83. **Cyclic ketones and thiones.** When a cyclic system whose leading function is ketone or thione originally had two hydrogens in the site where O= or S= are attached, the compound gets the name of the parent compound with the ending **-one** or **-thione** *e.g.:*

Tetralin

2-Tetralone

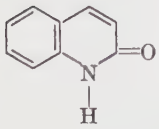


Pyran



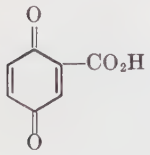
4-Pyrone

The ring system so obtained (including oxo- or thioxo- functions) may be used as a new ring system for the naming of compounds containing higher order functions (see paragraph 21); *e.g.:*



4-Pyrone-3-carboxylic acid

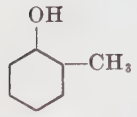
If the compound originally had only one hydrogen at the site of the ketonic function, the particles **oxo-** or **thioxo-** together with **dihydro-, tetrahydro-,** etc. are used; *e.g.:*



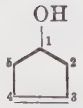
Quinoline

Quinoline, 1,2-dihydro-2-oxo-

84. **Quinones.** IUC rule 46 is followed. The quinone ring system may be used as a basis for the naming of compounds containing higher order functions.



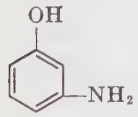
1,4-Benzoquinone-2-carboxylic acid



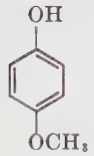
ALCOHOLS

85. **Aliphatic alcohols** appear under their Geneva names (IUC rule 20).

86. **Monocyclic aliphatic alcohols** appear under their Geneva names (IUC rule 20); *e.g.:*

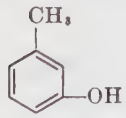


Cyclohexanol, 2-methyl-

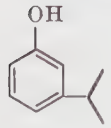


3-Cyclopenten-1-ol

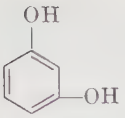
87. **Heterocyclic and aromatic alcohols (phenols).** The name **Phenol** is used for C_6H_5OH and ring substituted derivatives with **no carbon** attached to the ring and no other hydroxyl group or higher order of precedence functions; *e.g.:*



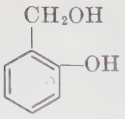
Phenol, 3-amino-



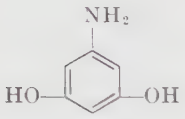
Phenol, 4-methoxy-



Otherwise the compound appears under benzene, toluene or elsewhere; *e.g.:*

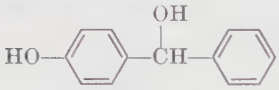


Toluene, 3-hydroxy-

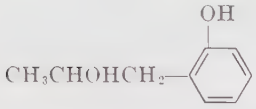


Benzene, 1-hydroxy-3-isopropyl-

Benzene, 1,3-dihydroxy-
(cross-reference under **Resorcinol**)

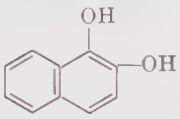


Toluene, *a*,2-dihydroxy-

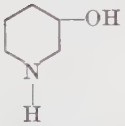


Benzene, 1-amino-, 3,5-dihydroxy-

Alcohols precede phenols in order; *e.g.:*



Methanol, (4-hydroxyphenyl)phenyl-



2-Propanol, 1(2-hydroxyphenyl)-

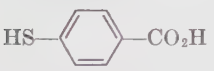
Exception: **Toluene, *a*-hydroxy-,** *not* **Methanol, phenyl-**
Other aromatic and heterocyclic phenols or alcohols will be named considering the hydroxyl group as an ordinary substituent; *e.g.:*

Naphthalene, 1,2-dihydroxy-

Piperidine, 3-hydroxy-

88. **Polyalcohols** such as **glycerol, erythrol,** etc. appear under their trivial names. Exception: **1,2-ethanediol.**

89. **Sugars** appear under their trivial names.



90. **Esters of complicated alcohols.** See paragraph 58.

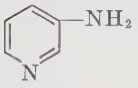
91. **Hemiacetals and hydrates of aldehydes and ketones.** See paragraph 68.

92. The **carbinol** nomenclature for alcohols **is not used.**

93. **Thiols.** Aliphatic thiols follows IUC rule 22. Aromatic and heterocyclic thiols and molecules containing higher order functions together with the SH group will be named using the particle **mercapto.** Thiol is lower than alcohol but higher than amine in the order of precedence; *e.g.:*

CH_3CH_2SH **Ethanethiol**

Benzoic acid, 4-mercapto-



$HSCH_2CH_2OH$ **Ethanol, 2-mercapto-**

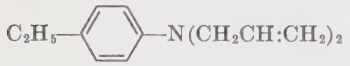
94. **Hydroperoxides.** See paragraph 112.

AMINES AND IMINES

95. The amine function is generally considered as an ordinary substituent (like **chloro-, nitro-,** etc.) *e.g.:*

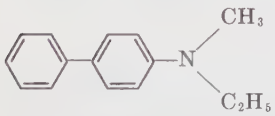
$CH_3CH_2NH_2$ **Ethane, amino-**

Pyridine, 3-amino-



96. The name **aniline** is used for the compound $C_6H_5NH_2$ and as a parent compound for its derivatives unless a carbon atom is attached to the benzene ring or a function of rank higher than amino is present in the molecule; *e.g.:*

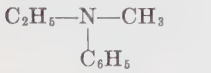
Aniline, 4-nitro-



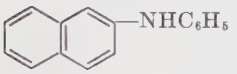
Phenol, 4-amino-

Benzene, 1-diallylamino-4-ethyl-

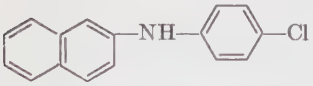
Acetic acid, amide, *N*-phenyl-
(cross reference under **Acetanilide**)



Biphenyl, 4(ethylmethylamino)-



97. A list of names beginning with the word *Amine* appears in the Table; sometimes a cross-reference is given to the preferred name based on the largest radical present. If the choice is between a saturated and an unsaturated radical of the same number of carbon atoms, the unsaturated one is preferred. Regarding this nomenclature see paragraph 25.

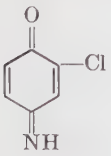


Amine, dibenzyl-

Amine, ethyl methyl phenyl,
see **Aniline, *N*-ethyl-*N*-methyl-**

Naphthalene, 2(phenylamino)-,
see **Amine, 2-naphthyl phenyl**

Amine, 2-naphthyl phenyl, 1,4′-dichloro-
(see paragraph 25)



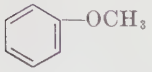
98. **Hydroxylamine derivatives.** See paragraph 111.

99. **Imines.** The particle **imino-** is used for the group NH= when it is attached to a single carbon atom; *e.g.:*

Ethane, imino-

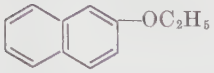
In some instances when the *imine* group comes in place of the oxygen of a keto-group the word imine appears after the name of the ketone; *e.g.:*

1,4-Benzoquinone, 2-chloro, 4-imine



(This is similar to the usage in the case of oximes, see paragraph 72.)

ETHERS



100. Simple and complex monoethers are found under the name **Ether** followed by the two radicals (without substituents) attached to the oxygen in alphabetical order and finally followed by the substituents in the skeleton of the ether (see paragraph 25); *e.g.:*

CH_3OCH_3	**Ether, dimethyl**
$BrCH_2OCH_2Br$	**Ether, dimethyl, 1,1′-dibromo-**
$(C_6H_5)_2CHOCH_3$	**Ether, (diphenylmethyl) methyl**
$C_6H_5CH_2OC_6H_5$	**Ether, benzyl phenyl**
$HC{:}COC_6H_5$	**Ether, ethynyl phenyl**

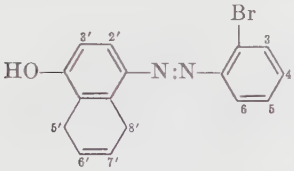
101. Alkoxy derivatives of benzene (linear, saturated and with less than 6 carbons) and alkoxy derivatives of polycyclic or heterocyclic hydrocarbons appear under the cyclic hydrocarbon as a parent compound; *e.g.:*

Benzene, methoxy
(cross-reference under **Anisole**)

Isoquinoline, 3-ethoxy-

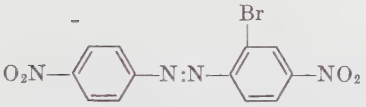
102. **Epoxy compounds.** Follow IUC rule 24, but cyclic ethers such as **furan, dioxan, dioxolan,** etc. are designated by their heterocyclic system name.

103. **Polyethers.** Some appear under their trivial names. Ethers of polyalcohols sometimes appear after the name of the corresponding alcohol.



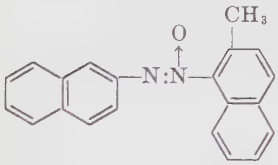
104. **Peroxides.** See paragraph 112.

105. **Thioethers.** See paragraph 114.



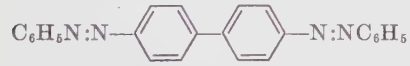
106. **Orthoesters.** See paragraph 47.

MISCELLANEOUS FUNCTIONS



107. **Azo and azoxy compounds. Azo** and **Azoxy** are the headings for these compounds. After the word **azo** or **azoxy** comes the names of the hydrocarbon (if symmetrical) or hydrocarbons (if unsymmetrical) attached to the azo or azoxy group in alphabetical order; places of substitution are given with unprimed numbers for the first hydrocarbon and primed numbers for the second hydrocarbon (see paragraph 25); *e.g.:*

Azo, benzene 1-naphthalene, 2-bromo$_2$, 4′-hydroxy-



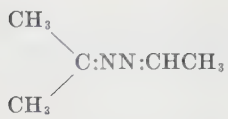
Azobenzene, 2-bromo-4,4′-dinitro-

1,2′-Azoxynaphthalene, 4′-methoxy-2-methyl-

In the case of **azoxy** no attempt is made to distinguish between the nitrogen atoms.
Some of the azo compounds are cross-referred to other parent compounds (see paragraph 48).
Some multiple azo compounds are named by derivation from the most highly substituted nucleus; *e.g.:*

Biphenyl, 4,4′-bis(phenylazo)-

108. **Azides.** Azides of acids according to paragraph 54.
For other azides the particle **triazo-** is used (see paragraph 31); *e.g.:*



Ethane, triazo-

109. **Azines.** Appear under the name of the corresponding aldehyde or ketone if they are symmetrical; if not, under two headings with cross references; *e.g.:*

2-Butanone, azine

2-Propanone, azine with acetaldehyde

see **Acetaldehyde,** azine with 2-propanone

110. **Hydrazine derivatives.** Monoacyl derivatives of hydrazine are entered under the name of the acid followed by the word hydrazide; *e.g.:*

$CH_3CONHNH_2$ — **Acetic acid,** hydrazine

Diacyl hydrazines appear under **Hydrazine,** *e.g.:*

$CH_3\underset{1}{C}O\underset{2}{N}HNHCOC_6H_5$ — **Hydrazine, 1-acetyl-2-benzoyl-**

When a function of higher order of precedence (amino or higher) is also present, it may be convenient to use the particle **hydrazino-;** *e.g.:*

$NH_2NHCH_2CH_2CN$ — **Propanoic acid, 3-hydrazino,** nitrile

$\underset{1}{NH_2}\underset{2}{NH}\underset{3}{C}O\underset{4}{NH_2}$ — is **Semicarbazide,** with derivatives under this name, but semicarbazones appear under the corresponding ketone or aldehyde.

$\underset{1}{NH_2}\underset{2}{C}O\underset{3}{N}H\underset{4}{N}H\underset{5}{C}O\underset{6}{NH_2}$ — is **Biurea,** with all its derivatives appearing under this name.

111. **Hydroxylamine derivatives. Hydroxylamino-** is used for HONH—, and **aminooxy** for NH_2O—. Names of *N*-acyl derivatives of hydroxylamine are derived from that of the corresponding amide; *e.g.:*

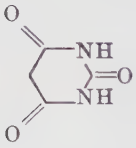
$CH_3CONHOH$ — **Acetic acid,** amide, *N*-hydroxy-

Oximes are explained in paragraph 72.

112. **Peroxides and hydroperoxides.** Peroxides are listed under **Peroxide** and hydroperoxides are listed under **Hydroperoxide;** *e.g.:*

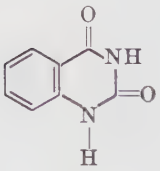
C_2H_5OOH	**Hydroperoxide, ethyl**
$C_6H_5CH_2OOCH_2C_6H_5$	**Peroxide, dibenzyl**
$C_6H_5OOCH_3$	**Peroxide, methyl phenyl**

113. **Miscellaneous Phosphorus, Arsenic and Antimony Compounds.** IUC rule 34 is followed.



114. **Sulfides, disulfides, trisulfides sulfoxides and sulfones** follow rules identical to those of **ethers** see (paragraphs 100, 101), using an appropriate word or particle, as in the following examples:

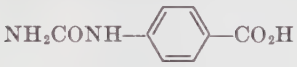
CH_3OCH_3	**Ether, dimethyl**
CH_3SCH_3	**Sulfide, ,,**
CH_3SSCH_3	**Disulfide, ,,**
CH_3SSSCH_3	**Trisulfide, ,,**
$CH_3S(O)CH_3$	**Sulfoxide, ,,**
$CH_3S(O_2)CH_3$	**Sulfone, ,,**
$CH_3OC_2H_5$	**Ether, ethyl methyl**
$CH_3SC_2H_5$	**Sulfide, ,, ,,**
$CH_3SSC_2H_5$	**Disulfide, ,, ,,**
$CH_3SSSC_2H_5$	**Trisulfide, ,, ,,**
$CH_3S(O)C_2H_5$	**Sulfoxide, ,, ,,**
$CH_3S(O_2)C_2H_5$	**Sulfone, ,, ,,**
$C_6H_5OCH_3$	**Benzene, methoxy-**



$C_6H_5SCH_3$	**Benzene, methylthio-**
$C_6H_5SSCH_3$	**,, methyldithio**
$C_6H_5SSSCH_3$	**,, methyltrithio-**
$C_6H_5S(O)CH_3$	**,, methylsulfinyl-**
$C_6H_5S(O_2)CH_3$	**,, methylsulfonyl-**

115. **Urea derivatives.** According to IUC rule 36.

Cyclic urea derivatives are named according to their ring system or trivial names:



Barbituric acid

Quinazoline, 2,4-dioxo-1,2,3,4-tetrahydro-

The ureido function follows in order of precedence after the onium and the acid functions. The particle **ureido-** is used for the group NH_2CONH— and **thioureido-** for NH_2CSNH—; *e.g.:*

Benzoic acid, 4-ureido-

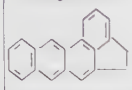
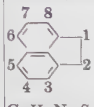
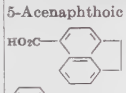
1 For I.U.C. rules of nomenclature see General Index.

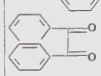
2 Generally means ethyl alcohol.

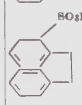
3 The abbreviation of a color ending in "sh" is to be read as ending with the suffix "-ish," *e.g.*, grsh means greenish.

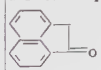






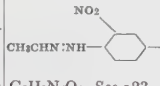






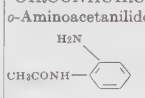
4 *D, L* generally mean configuration and *d, l* generally means optical rotation, but there are many examples in the chemical literature for which the meaning of these symbols is ambigous and/or interchangeable.

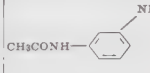
5 Generally means diethyl ether.

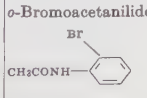


6 *N* indicates a position in the molecule.

7 For additional information, see Table of Natural Products, according to section and number of entry indicated, *e.g.*, Nat. E2.







8 *s* and *sec.* or *t* and *tert*, are used as convenient.
